1. TrakBox panel layout gif file

Newsgroup: rec.radio.amateur.space
Date: 1994-01-01 01:23:26 UTC
From: fmitch@netcom.com
Message-ID: <fmitchCIxFv2.9z8@netcom.com>
Source record: 28405

hi, mitch, wa4osr here in mobile, al...

i am building the tapr/jamsat trakbox from the tapr kit... i have
laid out a front panel for it with the help of raymond, w4ujz...
the layout, front and back, was done using corel draw... i have
the files available if anyone wants to look at them... and i also
made a gif of the layout that i can ftp to anyone wanting to look
at it... the layout is really spiffy, with the tapr and the jamsat
logos, and a place for your callsign... raymond has developed a
technique for transfering the image to a panel, which we will
be publicizing soon...

for a copy of the files email me...

mitch, wa4osr

SB ALL @ AMSAT $ANS-001.02
HR AMSAT NEWS SERVICE BULLETIN 001.02 FROM AMSAT HQ
SILVER SPRING, MD January 1, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-001.02

RV3DR, QSL manager for MIR contacts, advises that on December 24,
1993, December 31, 1993 and January 6, 1994 the MIR space station
will be transmitting special digitized voice messages on its
normal frequency of 145.55 MHz. The message repeats every tow
minutes. Sergey says that the developer of this equipment is
DL2MDE.

ANS thanks RV3DR for the information that went into this bulletin
and James Mollica N2NRD for relaying it to us.

SB AMSAT @ WW $ANS-001.01
HR AMSAT NEWS SERVICE BULLETIN 001.01 FROM AMSAT HQ
SILVER SPRING, MD January 1, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-001.01

A number of messages have recently been posted to the AMSAT BBS concerning the schedules for the various satellites and how they are arrived at. In the case of OSCAR-13, the schedule is determined by the AO-13 Command Team consisting of James Miller G3RUH, Peter Guelzow DB2OS and Graham Ratcliff VK5AGR. As to how these volunteers determine the schedule, a very fine set of comments was posted by Paul Beckmann WA0RSE Internet address wa0rse@amsat.org. The AMSAT News Service thanks Paul for his well-put comments and has taken the liberty of extracting them for this bulletin.

Paul begins by asking himself: What determines the mode schedule for a satellite? He says thae he found an answer in the very clearly written piece in the 1993 Space Symposium Proceedings by, you guessed it, James, G3RUH.

In his attempt to put the article by James in terms that may not be obvious to new to satellites as well as many not so new "bird-watchers", Paul offers a list of some of the important considerations:

1. All modern satellites are battery-powered with solar cell recharging systems. In order to work, the batteries must stay charged.

2. Most satellites do not have solar cells covering their entire surface. This means the attitude of the satellite with relation to the sun must be managed to keep the batteries charged.

3. The antennas are fixed to the satellite, not steerable, and necessarily "go along for the ride" when accomplishing Item 2.)

4. Each mode involves a receiver, a transmitter, and a pair of antennas. The receivers vary in sensitivity, the transmitters in power, and the antennas in gain and beamwidth.

5. Because of Item 3, the characteristics of item 4 allow transponder operation only in particular modes, when the distances and spacecraft attitudes are within certain limits. For example, a narrowbeam antenna pointing away from the Earth will not support

communications. If a particular mode requires the use of that antenna, it would not do any good to place the satellite in that mode, no matter how badly it was desired. To change the attitude of the spacecraft to point the antenna at the Earth could very well compromise solar cell illumination, hence battery charge, hence spacecraft operation - and possibly even its life expectancy.

6. Because some modes draw more power than others, the battery power must be budgeted. This also constrains how long the satellite can operate in any particular mode.

Paul admits to possibly missing some other major points, but he believes that these demonstrate to him, at least, that the mode schedule on AO-13, or any other bird, is not a self-serving decision made by some "elite superclass" who treat the bird as a "toy", but are considered decisions, constrained by the physics of the orbit, solar cells, batteries, equipment aboard, antennas, etc., designed to offer the best long-term schedule of transponder operation and to further the state-of-the-art for the next birds' designs.

WA0RSE strongly suggests reading the article by James in the Proceedings. He says that he was amazed at the number of specialized programs that had been written, complete with graphical output, to aid in the decision-making process to keep the AO-13 satellite operational. He expressed his opinion that James, and others like him, should be thanked for bringing clear explanations like these to the rest of us and for fostering experimentation in modes that have proven to provide better two-way satellite communications for our fellow hams across the globe.

Paul sums up his message by saying that we need everyone interested in AMSAT, with their opinions, tempers, passions, talents, and good humor. He also wishes all a Happy New Year. Peace on Earth. Good will toward all.

Information on ordering a copy of the Space Symposium Proceedings, which contains James Miller's article can be found on page 12 of the Nov/Dec AMSAT Journal.

4. TrakBox panel layout

Newsgroup: rec.radio.amateur.space
Date: 1994-01-03 04:51:53 UTC
From: fmitch@netcom.com
Message-ID: <fmitchCJ1EuI.I6E@netcom.com>
Source record: 28408

this is a generic reply to all email in response to my trakbox panel
layout post to the usenet and i am also posting this msg on compuserve...

the panel layout is enclosure specific for the Bud LB-1663 Contempo
box... this box is a 'ten-tec' type box, gray in color with black plastic
side panels, with the following dimensions:

3 1/4" high
7 1/32" wide
7 3/16" deep

the box is a mite too small for the pcb to fit into the pcb grooves molded in
the plastic side panels, therefore you have to *trim* the printed circuit
board by about 3/16 ths of an inch... this is easily done with a hand file...
it is *much* easier to do if you haven't populated the board... if you
don't want to trim your pcb you can still use the layout as an
example of "how to do it"...

the current layout is for the switches furnished with the first batch of kits...
the second batch of kits is currently being 'kitted'... the satellite
selector switch for the second batch of kits will be a thumbwheel type...
i am being loaned one of the new type switches and will modify the panel
layout to accomodate either switch...

i will be posting the corel draw file and also a gif file to compuserve as soon
as we have the layout modified for the new type selector switch... (if anyone
needs a different file type please let me know... i can furnish any file type
supported as an export file from corel draw 3) ... look for
a filed named tboxpanl.zip or something similar... a warning on the
gif file --- it looses much detail, and is only useful for you to grab a
quick peek at the layout...

i am looking for a ftp site to upload the files for internet access, any
suggestions for a public accessable location will be appreciated...

if you need the files directly, you can download the zip file from
my data line, see below, or send me a blank, *formatted* disk of any
flavor, along with return postage... i will dump the files on your disk and
mail them back to you...

thanks,
mitch, wa4osr

MONDAY JANUARY 3, 1994

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It is published every week and is made available for unlimited distribution.

* SUPERPRESSURE BALLOON LAUNCH *
================================
A cooperative group from Utah State University, Logan, Utah, members of the Amateur Radio community, and Winzen International plan to launch SuperBall 1-94 at approximately 10:00 A.M. MST (17:00 UTC) on January 5, 1994 from the Logan Municipal Airport. The nylon superpressure balloon for this flight is 76 feet in diameter and was manufactured and donated by Winzen International of San Antonio, Texas. The expected daytime float altitude of this helium filled balloon will be 120,000 ft (36,660 meters), with some loss of altitude expected at night. Superpressure technology is capable of maintaining a payload at such an altitude for long periods of time, potentially years.

The initial track of SuperBall will depend on upper air conditions at the time of launch, but is expected to be in the semicircle east from Utah. Possible scenarios might then take it over the Atlantic Ocean or into the polar regions within a few days.

The payload will be limited to a gross weight of 4 kilograms, or 8.8 pounds. It will consist of the following subsystems:

1) An instrument package containing a five channel Magellan GPS receiver, an external air temperature sensor, an internal payload temperature sensor, a battery voltage sensor, and a differential pressure gauge.

2) A 1/2-watt VHF MCW beacon operating on 145.871 MHz with the callsign N7YTK. Every minute it will transmit data from instruments listed above. (This transmitter will also operate through the Russian RS-10 Amateur satellite, which has a downlink frequency of 29.371 MHz, plus or minus Doppler.)

3) A one-watt CW 15-meter beacon operating on 21.229 MHz with a call sign of WB8ELK. Every five minutes it will transmit data identical to that sent on the 145.871 MHz beacon. (This signal will also be relayed through the Russian RS-12 Amateur satellite, which has a downlink frequency of 29.429 MHz, plus or minus Doppler.)

4) An ATV system consisting of a black-and-white CCD camera and associated one-watt transmitter operating on 434.00 MHz in continuous bursts on command.

5) A cutdown package containing a VHF command receiver, DTMF decoder and barometric switch, and

6) Several Lithium battery packs.

Depending on weight availability, two additional beacons are possible:

7) A one-watt VHF AFSK beacon transmitting ASCII data at 1200 baud on 145.968 MHz every two minutes in alteration with the beacon in (2) above, with the call sign of WB8ELK (also operating through the Japanese FO-20 satellite, which has a downlink frequency of 435.832 MHz), and

8) A 60-milliwatt 10-meter CW beacon operating on 28.322 MHz every minute, with a call sign of WB8ELK, transmitting pressure altitude, internal temperature, external temperature and battery voltage. Item (8) will contain either a 9-volt lithium pack that should last a month, or a 9-volt, 150 ma solar panel, lasting indefinitely.

The purpose of the SuperBall 1-94 mission is to certify this superpressure balloon technology for long-duration flight and to test the ability to control and receive data from a high-altitude research balloon for an extended period of time.

The first plateau of success will be achieved if it is possible to operate through a complete sunset/sunrise cycle at a constant pressure altitude. The second plateau will be a flight lasting a week. The third plateau will be a complete circumnavigation of the globe. Anything after that is gravy.

The float path of the balloon is very difficult to predict since the polar breakout that usually occurs this time of year frequently results in strong north-south currents. Observers from the Jet Propulsion Laboratory, Martin Marietta and Utah State University's Space Dynamics Laboratory will be present at the launch. These people are potential users of the superpressure balloon for a future Martian mission.

An HF net will be conducted by John Luker, WB7QBC, (Internet: WB7QBC@uugate.aim.utah.edu) on the day of the launch and subsequent days on 7230 KHz +/- QRM. This net will alert interested hams downrange of the balloon's path, and coordinate the collection of telemetry. The Utah Balloon Team would appreciate the forwarding of any telemetry copied to John's address along with pertinent information, including the receiving station's location, UTC date and time, signal report, and receiving equipment. Video tapes of any received ATV transmissions from the balloon would also be appreciated. The camera is only expected to be turned on during the first two days of the mission.

Questions should be directed to Bruce Bergen, KI7OM, via his Internet address: KI7OM@uugate.aim.utah.edu.

[Info via N2NRD]

* FO-20 OPERATION SCHEDULE *
============================
The following is the current operating schedule for FO-20:

ANALOG MODE:

15-Dec-93 7:41 -to- 22-Dec-93 8:05 UTC
29-Dec-93 8:30 -to- 05-Jan-94 8:50 UTC
12-Jan-94 7:30 -to- 19-Jan-94 7:50 UTC
26-Jan-94 8:20 -to- 02-Feb-94 6:50 UTC
09-Feb-94 7:15 -to- 16-Feb-94 7:40 UTC

The digital (Mode JD) transponder is available at all other times.

[Info via Kazu Sakamoto, JJ1WTK]

* NASA SELECT TV IS MOVING! *
============================
The satellite feed for NASA Select Television will be moving soon. To obtain details on the new location for NASA Select, please contact Patsy Respess at (202) 358-1701. The reason for this contact is that NASA is trying to determine how NASA Select material is being used and by whom. If you are a NASA Select user, please call NASA and let them know.

[Info via Mark Perew]

Hi

For erresearch purposes I require old files of the
NORAD orbital parameters, files tle.255 to tle.300.
Could someone help me with locating these files or if they have copies
of them I would appreciate it if I could get access to them.

Thank you in advance.

I noticed that no one has mentioned TrakSat ver 2.8 for DOS.
I perfer this one because of the nice docs that come with the zipped
package, its very easy to use, and has a few different output formats,
this allows me to chose the style of output I want for that session
and not have to learn a new piece of software if I want a graphic style
output instead of my usual character based analytical solution.
All that time spent editing control files was also becoming a tedious
chore. IMHO

Peter

11. Direct Bcdst TV Sat

I know this isn't an OSCAR satellite question but
I have not been able to find information elsewhere.

I wondered about the status of the GM/Hughes
direct broadcast TV satellite which was supposed
to be launched in December.

What is the latest launch date?
Where is it to be launched from? Kennedy?

Thanks.

Ron w8gus.

Where can I find this program? What FTP site?

Thanks.

13. Advice sought on sat gear: 2510/ft480?

Newsgroup: rec.radio.amateur.space
Date: 1994-01-05 00:49:11 UTC
From: white@csusys.ctstateu.edu
Message-ID: <1994Jan4.194911.1@csusys.ctstateu.edu>
Source record: 28266
Cross-posted to: rec.radio.amateur.space,rec.radio.amateur.misc

I'm getting ready to work the Oscars, and I have a
couple of options for outfitting my station. I currently
have an HF receiver, and my only amateur rig is a TH78A HT.
I have a chance to pick up a Yaesu FT480R 2m all-mode and/or
a Ten-Tec 2510 (mode B rig). I'm looking for some help on
the decision-making process. The Yaesu would be nice for
2m DXing; however, I don't own an HF transmitter to couple
to a transverter. The 2510 would get me working the sats
a lot quicker, but it is strictly mode B. Hey. I'm stumped.
Help?

SB AMSAT @ WW $ANS-001.03
ANS001.03 Experimenter's Day Returns to AO-16
HR AMSAT NEWS SERVICE BULLETIN 001.03 FROM AMSAT HQ
SILVER SPRING,MD January 1, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-001.03

Experimenter's Day Returns to AO-16

AO-16 Command Team Leader, Russ Platt, WJ9F, announces the resumption of Experimenter's Day on Pacsat. In the past Experimenter's Days on Pacsat the procedure was to change to the Pacsat Raised Cosine PSK transmitter on 437.050 Mhz and activate the S-Band transmitter on 2400.143 Mhz. With the decline of the carrier suppression on the "Straight" PSK transmitter (437.025 Mhz) the RC PSK transmitter has become the primary downlink for some time. In the upcoming schedule of Experimenter's Days the power output will be reduced on the RC PSK transmitter and the S-Band transmitter will be turned on. The power output from the S-Band transmitter is not variable so power management is controlled by varying the output of the RC PSK transmitter.

Experimenter's Days managed by AMSAT-NA have been held on UTC Wednesdays since the days of AMSAT-OSCARS 6 and 7 when Wednesday was " battery recharge day." (Incidentally, this is also the reason that the continental U.S. 75 meter nets were originally scheduled for Tuesday evenings.)

Future Experimenter's Days are scheduled for:

05 January 0411 UTC through 06 January 0340 UTC
26 January 0400 UTC through 27 January 0330 UTC

15. ans001.04 Recommended Operation Procedure to Reduce AO-16 Uplink Contention

Newsgroup: rec.radio.amateur.space
Date: 1994-01-05 03:11:41 UTC
From: 70774.641@compuserve.com
Message-ID: <$ans-001.04.1994@ampr.org>
Source record: 28268
Cross-posted to: rec.radio.amateur.space,rec.radio.info

```
SB AMSAT @ WW $ANS-001.04
ans001.04 Recommended Operation Procedure to Reduce AO-16 Uplink Contention
HR AMSAT NEWS SERVICE BULLETIN 001.04 FROM AMSAT HQ
SILVER SPRING, MD January 1, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-001.04

Recommended Operation Procedure to Reduce AO-16 Uplink Contention

1993 has brought many new satellites and many new satellite users. I feel
it would be good to dust off an old bulletin from 1991 to help refresh
the "old-timers" procedures and to aquaint new users to the recommended
uplink frequency usage.
The AO-16 Command Team recommends that users of the AO-16 PBBS system
use only uplink channel D (145.960 Mhz) for download and directory requests
leaving channels A, B, and C (145.900, 145.920, and 145.940 Mhz) for file
uploads and digi users.
Stations uploading files should stay off of the download/directory/fill
request channel D as their longer uplink packets will collide with the
shorter request packets. Stations doing downloads and directories should
stay off channels A, B, and C since their frequent but short requests will
collide with longer uplink attempts seriously degrading uplink performance.
Another benefit of using this procedure, while most of the uplink activity
to AO-16 will be on channel D (145.960) this frequency is high enough in the
passband of AO-13 that QRMing our fellow operators will be kept to a minumum
when Pacsat crosses beneath AO-13's path.

Recommended AO-16 operating practice in summary:

Downlinks: 437.050 (also 2400.143 on experimenter's day.)
Uplinks: 145.900 A uploads
145.920 B uploads
145.940 C uploads
145.960 D downloads, fills and directory requests

WJ9F / AO-16 Command Team Leader

23. Keplerian data for moon?

Newsgroup: rec.radio.amateur.space
Date: 1994-01-07 14:47:35 UTC
From: mawhinne@shrike.und.ac.za
Message-ID: <2gjsm7$7ju@owl.und.ac.za>
Source record: 28272

Hi!

I have a friend who is interested in doing some moon-bounce work, and wants to be able to accurately track the position of the moon.

I've had a quick look through the FAQ, but I couldn't find any pointers to Keplerian data on the internet. Is there an FTP site for Keplerian data? Or can someone send me the Keplerian elements for the moon?

Thanks,
Bryan

NASA tv moves

NASA Television is moving. NASA TV is received by dish or
available through your local cable television network.
The new satellite is Spacenet 2, transponder 5, C Band, 69
degrees West longitude, frequency 3880.0 MHz, horizontal
polarization, audio on 6.8 MHz. The NASA Television
service offers daily educational and information
programming, carries Shuttle launches and mission
coverage, and occasionally airs live coverage of Shuttle
Amateur Radio EXperiment activity. The move will occur at
1500 UTC on Saturday, January 8. For more information,
please contact the ARRL Educational Activities
Department.

25. Two-Line Orbital Element Sets (TLE322)

Newsgroup: rec.radio.amateur.space
Date: 1994-01-08 04:53:31 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.758004811@afit.af.mil>
Source record: 28282
Cross-posted to: rec.radio.amateur.space,rec.radio.info

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.info.
This week's elements are provided below.

Hej Bryan.

Friday January 07 1994, Bryan Mawhinney writes to All:

BM> From: mawhinne@shrike.und.ac.za (Bryan Mawhinney)

BM> I've had a quick look through the FAQ, but I couldn't find any
BM> pointers to Keplerian data on the internet. Is there an FTP site
BM> for Keplerian data? Or can someone send me the Keplerian
BM> elements for the moon?

I really don't think that there are any keplerian data for the moon. There is
some software availbale for moon tracking though.

H{lsningar
Danny

I dont think you need keppler elements for the moon if you get
a trackingprogram that have the moon and the sun "hardcoded" in the program
itself.
One such program is the Instant Tracker as i myself use for satellite tracking
i actually calibrated my antenna systems by pointing at the moon and then run
outdoors to adjust the mecanic fastingpoints and adjustment of my rotor and
mast.
When i checked this against satellite AOS and LOS and also with a magnetic
compass a was startled with the accurasy.
So if you are using a PC computer i sugest using Instant tracker.
You can get from the American Radio Relay League
Newington, CT 06111 USA

Good luck with the moon tracking.

ZACH@GEMINI.LDC.LU.SE

There are quite a few programs available designed especially for EME. And they
are _much_ better than those designed to track satellites. One of the best
is made by VK3UM. And you'll get it for free ! Try your local ftp site or
ftp.funet.fi (128.214.6.100), the path is pub/ham/vhf-work/eme-vk3um.zip

I have been very pleased with this one but I would like to hear what
kind of features does ie W5UN's program have. Is it worth the money ?

29. Traksat 3.00!

Newsgroup: rec.radio.amateur.space
Date: 1994-01-09 20:33:00 UTC
From: leo.wikholm@compart.fi
Message-ID: <1f.174.1818.0NC5BAD3@compart.fi>
Source record: 28283

According to Paul E. Traufler:

A new version of TRAKSAT is now available to registered users.
This represents a new look and feel for the program. The user
interface has been updated to today's standards with things like
list boxes of satellite names or tracking stations so you don't
have to type anything. Squint angle calculations along with
Doppler shift for uplinks and downlinks are provided. Multi-
satellite modes are greatly improved and several multi-station
modes are now available also. High resolution SVGA modes are
available and improved a monochrome mode. Output to the screen a
file or both can be easily accomplished with this version. Graphic
screens can now be saved to PCX file with just a key press.

Leo Wikholm

SB SAT @ AMSAT $ANS-008.01
PoSAT-1 BBS TO OPEN

HR AMSAT NEWS SERVICE BULLETIN 008.01 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 8, 1993
TO ALL RADIO AMATEURS BT
BID: $ANS-008.01

PoSAT-1 Opens For Radio Amateur Use

As many of you may already know, PoSAT-1 was built at University of Surrey and is owned by a Portuguese Industrial Consortium. It carries a commercial and an Amateur Radio payload. The Amateur Service hasn't yet started operation because of some doubts about the use of PoSAT-1 were brought up because of the the possiblity of misuse of the Amateur Radio spectrum.

AMSAT-PO (the Portuguese AMSAT "branch") and others were very worried about this situation, and after a few setbacks and many meetings, a protocol was finally established between the PoSAT Industrial Consortium and AMSAT-PO on 6-DEC-93. The main concern of AMSAT-PO was always to protect the Amateur bands and the Amateur code and practice.

Jose Carlos (CT1ERC) has provided the main points of that agreement which are as follows:

* RAM memory allocated to the Amateur store-and-forward BBS: at least 6 MB out of a total of 16 MB;

* The operating schedule (between the commercial and Amateur service) will be valid for two years and may be re-negotiated every two years;

* The Amateur ground stations are allowed to download all the files related to the technical and scientific experiments onboard, but by imposition of the Consortium, the IMAGES TAKEN BY THE ONBOARD CCD CAMERAS WILL NOT BE MADE AVAILABLE TO THE AMATEUR RADIO SERVICE!!!

In a meeting held recently between AMSAT-PO officials and the PoSAT Consortium the schedule approved is as follows:

EVERY minute PoSAT will be 5 seconds in the commercial frequencies and the remaining 55 seconds in the amateur frequencies. The Consortium feels that they need at lest 5 seconds to download the images. The telemetry will be downloaded in the amateur frequencies as well. This schedule will be valid starting on 07-JAN-94.

Since the amateurs aren't allowed to download the image files from the onboard cameras, there are the two experiments that will, however, be quite

interesting. The are the following:

1) The onboard GPS receiver: if everything goes as expected, the days of difficult tracking are over. Just wait the AOS and the satellite will tell you were it is and where to point your antennas, if you know your QTH position.

2) The possibility of operation at 38.4 Kbps provided through the DSP system, which is will allow the amateurs to develope the necessary RF and digital techniques to go beyond 9600 baud. Imagine receiving about 100 Kbytes file in just 5 seconds!

PoSAT-1 will benefit mostly the amateurs that have 9600 baud operational capability and since there are only two of 9600 baud capable stations at the present time in Portugal operating regularly using these birds, your suggestions and comments would be most appreciated and might help AMSAT-PO in their contacts and negotiations with the PoSAT Consortium through AMSAT-PO.

The following are the PoSAT-1 radio amateur frequencies:

PoSat-1 Transponder Frequencies

UPLINK 145.975 MHz 145.925 MHz (Secondary)
DONWLINK 435.075 MHz 435.050 MHz (Secondary)

BBSCALL: posat-11 posat-12

[The AMSAT News Service (ANS) would like to thank Jose Carlos (CT1ERC) for this bulletin item. CT1ERC can receive your inquiries and comments on the BBS of KO-23 or at his INTERNET mailbox address of: J_CARDOSO%utad.pt@nunes.uminho.pt]

MIR GETS A NEW CREW

HR AMSAT NEWS SERVICE BULLETIN 008.02 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 8, 1993
TO ALL RADIO AMATEURS BT
BID: $ANS-008.02

New Cosmonauts To Begin Stay on MIR

Today, 08-JAN-94, a Soyuz TM-18 spacecraft was launched from Baikonur at 10:08 UTC with three cosmonauts aboard. The new cosmonauts are Victor Afanassiev (U9MIR), Yuri Usachov (R3MIR), and Valery Poliakov (U3MIR). The TM-18 spacecraft is scheduled to dock with the MIR space station on 10-JAN-94. The cosmonauts that are currently aboard MIR,Vassili Tsybliev and Alexander Serebrov (R0MIR), will return to earth on 14-JAN-94.

What is interesting to note about U3MIR is that he will attempt to break Musa Manarov record for remaining in space. U3MIR is a medical doctor and will remain aboard MIR until April '95.

The new MIR QSL Manager is Serge Samburov (RV3DR). He has held that position since January '93. To receive a QSL confirming your MIR contact, send your QSL cards to his postal address of: P.O.BOX 73, Kaliningrad-10 City, Moscow Area, 141070, RUSSIA. Also, you can send your inquiries to the following packet radio address: RV3DR#R#MIR or RV3DR@RK3KP.#MSK.RUS.EU.

[The AMSAT News Service (ANS) would like to thank RV3DR and LW2DTZ for this for the information which went into this bulletin item.]

STS-60 SAREX MISSION INFO

HR AMSAT NEWS SERVICE BULLETIN 008.03 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 8, 1993
TO ALL RADIO AMATEURS BT
BID: $ANS-008.03

Next SAREX Mission: STS-60

The STS-60 flight of the Space Shuttle Discovery represents the next Shuttle Amateur Radio Experiment (SAREX) mission. STS-60 is currently scheduled for launch on February 3, 1994 at 12:10 UTC. The primary payloads on-board STS-60 are the Wake Shield Facility and the second flight of the Spacehab, a pressurized module installed in the forward section of the Orbiter. The Spacehab science objectives are primarily micro-gravity oriented with emphasis on materials and life science.

The flight of STS-60 represents an historic first---the first joint U.S.-Russian Space Shuttle flight. This will be the first of several joint missions planned in preparation for the development of the international Space Station. Cosmonaut Sergei Krikalev, U5MIR, was chosen to be the first Russian to fly on the U.S. Space Shuttle. During the 8 day flight, Cosmonaut Krikalev will support the science operations on the Space Shuttle as Mission Specialist 4.

The SAREX operations on this flight include voice and packet. Preliminary discussions between the astronauts and the SAREX working group indicate that the Shuttle crew will be extremely busy with the numerous payloads on this flight. This information is being provided so the amateur community is aware that voice operations might be rare on this flight. Packet radio operations are expected when the crew is not engaged in voice operations. Please remember that this is a preflight prediction. The astronauts and the SAREX working group cannot guarantee this prediction. The following information sheet gives more details on SAREX operations for STS-60.

STS-60 Shuttle Amateur Radio Experiment (SAREX)
Information Sheet

Mission:STS-60 Space Shuttle Discovery
Wake Shield Facility & Spacehab-2 Mission

Launch: February 3, 1994, 12:10 UTC

Orbit: 57 degree inclination

Mission Length:8 days (Nominal)

Amateur Radio Operators: Charlie Bolden (License Pending), Ron Sega
(License Pending), Sergei Krikalev, U5MIR

Modes:FM Voice
Prime callsign: To be provided once Commander Bolden's callsign is known

Packet Radio: Callsign W5RRR-1

Frequencies: All operations in split mode. Do not transmit on
the downlink frequency.

Voice Freqs: Downlink: 145.55 MHz (Worldwide)
Uplinks: 144.91, 144.93, 144.95, 144.97,
144.99 MHz (Except Europe)
144.70, 144.75, 144.80 MHz (Europe only)

Note: The crew will not favor any specific uplink frequency, so your ability to
work the crew will be the "luck of the draw."

Packet Freqs: Downlink: 145.55 MHz
Uplink: 144.49 MHz

Info: Goddard Amateur Radio Club, WA3NAN, Greenbelt Maryland,
SAREX Bulletins and Shuttle Retransmissions

AO-13 TRANSPONDER SCHEDULES

HR AMSAT NEWS SERVICE BULLETIN 008.04 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 8, 1993
TO ALL RADIO AMATEURS BT
BID: $ANS-008.04

G3RUH Provides AO-13 "Provisional" Transponder Operating Schedules For '94

The AO-13 Ground Command Station of G3RUH has provided the "best guess" transponder schedules for the first half of '94. Please take the following schedules and paste them in a prominent place in your station.

AO-13 Provisional Mode Schedules 1994

L QST *** AO-13 TRANSPONDER SCHEDULE *** 1994 Jan 31-Apr 04
Mode-B : MA 0 to MA 90 |
Mode-BS : MA 90 to MA 120 |
Mode-S : MA 120 to MA 145 |<- S transponder; B trsp. is OFF
Mode-S : MA 145 to MA 150 |<- S beacon only
Mode-BS : MA 150 to MA 180 | Blon/Blat 180/0
Mode-B : MA 180 to MA 256 |
Omnis : MA 230 to MA 30 | Move to attitude 240/0, Apr 04

L QST *** AO-13 TRANSPONDER SCHEDULE *** 1994 Apr 04-Jul 11
Mode-B : MA 0 to MA 160 | OFF
Mode-B : MA 160 to MA 220 |
Mode-S : MA 220 to MA 230 |<- S transponder; B trsp. is OFF
Mode-BS : MA 230 to MA 250 | Blon/Blat 240/0
Mode-B : MA 250 to MA 256 |
Omnis : MA 250 to MA 160 | Move to attitude 180/0, Jul 11

G3RUH also has provided a table to indicate what the Bahn longititude and latitude for AO-13 will be in the upcoming year. Again, this information should be considered as the "best guess" and placed in a prominent place in your ham shack.

AO-13 Provisional Attitude Schedule 1994-5
==========

Date [Mon] Blon Blat SA to SA Weeks Notes

1994 Jan 31 180 0 -36 35 9
1994 Apr 04 240 0 -2 29 14
1994 Jul 11 180 0 36 -33 9
1994 Sep 12 230 0 0 -26 14 < Up to 132 minute eclipses
1994 Dec 19 180 0 -34 33 9 MA 96-107 Oct 22 - Nov 07
1995 Feb 20 230 0 12 21 14
1995 May 29 180 0 30 -31 8
1995 Jul 24 230 0 -10 -22 15 < Up to 132 minute eclipses
1995 Nov 06 180 0 -30 34 8 MA 96-103 Sep 05 - Sep 21
1996 Jan 01 230 0 9 -- --

Note: SA stands for "Sun Angle"

Unfortunately, because AO-13's perigee height has decreased from 1500 KM to 420 KM, G3RUH is unsure about whether AO-13 will still be in orbit by the end of '95 and into early '96. But if AO-13 has not re-entered into the earth's atmosphere, the above Bahn longitiude and latitude values will be the planned values.

[The AMSAT News Service (ANS) would like to thank G3RUH for this bulletin item. G3RUH can be reached at G3RUH @GB7DDX.#22.GBR.EU]

WEEKLY OSCAR STATUS REPORTS

HR AMSAT NEWS SERVICE BULLETIN 008.05 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 8, 1993
TO ALL RADIO AMATEURS BT
BID: $ANS-008.05

Weekly OSCAR Status Reports: 08-JAN-94

AO-13: Current Transponder Operating Schedule:
L QST *** AO-13 TRANSPONDER SCHEDULE *** 1993 Dec 27-Jan 31
Mode-B : MA 0 to MA 180 | OFF
Mode-B : MA 180 to MA 220 |
Mode-S : MA 220 to MA 230 |<- S transponder; B trsp. is OFF
Mode-BS : MA 230 to MA 250 | Blon/Blat 240/-5
Mode-B : MA 250 to MA 256 | OFF
Omnis : MA 250 to MA 150 | Move to attitude 180/0, 31-Jan-94
Poor Sun angle and battery testing need maximum OFF time.
[G3RUH/DB2OS/VK5AGR]

FO-20: The following is the current FO-20 operating schedule:
From January '94 thru February '94, the analog mode and the
digital mode will be on alternately for a week at a time.
ANALOG MODE:
12-JAN-94 7:30 -TO- 19-JAN-94 7:50 UTC

26-JAN-94 8:20 -TO- 02-FEB-94 6:50 UTC
09-FEB-94 7:15 -TO- 16-FEB-94 7:40 UTC
DIGITAL MODE: Unless otherwise noted above. [JJ1WTK]

AO-16: Operating normally. [WH6I]

LO-19: Operating normally. [WH6I]

KO-23: Up and running. Busy as usual. [WH6I]

The AMSAT NEWS Service (ANS) is looking for volunteers to contribute weekly OSCAR status reports. If you have a favorite OSCAR which you work on a regular basis and would like to contribute to this bulletin, please send your observations to WD0HHU at his CompuServe address of 70524,2272, on INTERNET at wd0hhu@amsat.org, or to his local packet BBS in the Denver, CO area, WD0HHU @ W0LJF.#NECO.CO.USA.NOAM. Also, if you find that the current set of orbital elements are not generating the correct AOS/LOS times at your QTH, PLEASE INCLUDE THAT INFORMATION AS WELL. The information you provide will be of value to all OSCAR enthusiasts.

31. SARSAT data decoding?

Newsgroup: rec.radio.amateur.space
Date: 1994-01-10 14:13:03 UTC
From: bennettj@world.std.com
Message-ID: <CJF3Hs.4Mw@world.std.com>
Source record: 28285

I work with search and rescue and track the SARSAT satellites, NOAA 9, 10 & 11 and Nadezhda 1, 2 & 3.
When 'on a mission' I receive details of satellite 'hits' from the Air Force Rescue Cooridination Center. I would like to experiment with receiving and decoding the 'hit' data directly.
Do you know how this is done, what format the data is in, and what downlink frequencies are used for the sarsat data?
The weather portion of the data is well documented but I cannot find anything on the ELT part.

* AO-16 NEWS *
==============
Recommended Operation Procedure to Reduce AO-16 Uplink Contention:

1993 has brought many new satellites and many new satellite users. It
would be good to dust off an old AMSAT bulletin from 1991 to help refresh
the "old-timers" procedures and to aquaint new users to the recommended
uplink frequency usage.

The AO-16 Command Team recommends that users of the AO-16 PBBS system
use only uplink channel D (145.960 MHz) for download and directory requests
leaving channels A, B, and C (145.900, 145.920, and 145.940 MHz) for file
uploads and digi users.

Stations uploading files should stay off of the download/directory/fill
request channel D as their longer uplink packets will collide with the
shorter request packets. Stations doing downloads and directories should
stay off channels A, B, and C since their frequent but short requests will
collide with longer uplink attempts seriously degrading uplink performance.
Another benefit of using this procedure, while most of the uplink activity
to AO-16 will be on channel D (145.960) this frequency is high enough in the
passband of AO-13 that QRMing our fellow operators will be kept to a minumum
when Pacsat crosses beneath AO-13's path.

Recommended AO-16 operating practice in summary:

Downlinks: 437.050 (also 2400.143 on experimenter's day.)
Uplinks: 145.900 A uploads
145.920 B uploads
145.940 C uploads
145.960 D downloads, fills and directory requests

* GST UPDATE FOR 1994 *
==========
For those tracking satellites with BASIC programs that require sideral
time constants, here is the Greenwich Sidereal Time (GST) for January 0,
1994:

G2 = 0.2761908

You will need to replace this value in your program for element sets
having Epoch years of 1994 and later. Don't forget that you can just use
a date of 13/01/93, 13/02/93, ... until you get 1994 element sets.

[Info via Dick, N3FKV]

* FO-20 OPERATION SCHEDULE *
============================
The following is the current operating schedule for FO-20:

ANALOG MODE:

12-Jan-94 7:30 -to- 19-Jan-94 7:50 UTC
26-Jan-94 8:20 -to- 02-Feb-94 6:50 UTC
09-Feb-94 7:15 -to- 16-Feb-94 7:40 UTC

The digital (Mode JD) transponder is available at all other times.

36. Re: Keplerian data for moon?

Newsgroup: rec.radio.amateur.space
Date: 1994-01-11 13:56:37 UTC
From: ae517@FreeNet.Carleton.CA
Message-ID: <CJGxEE.MEo@freenet.carleton.ca>
Source record: 28289

In a previous article, danny_kohn@sm0nbj.ct.se (Danny Kohn) says:

>I really don't think that there are any keplerian data for the moon. There is
>some software availbale for moon tracking though.
>
>H{lsningar
>Danny
>
MOON
1 0002 93360.0000000 0.0000000 00000-0 00011
2 0002 22.4297 346.9573 .040813 180.3337 265.5319 0.035749304251

I can not vouch for the long-term accuracy of these keps, as I merely
pulled them off the local packet bbs. The two times I have plugged them
into to mactrak, it seem to work, ie the software predicted that the moon was
visible, and lo and behold, that great orb in the sky was actually there!

amusez-vous bien!

38. what are the rules for retransmitting NASA select?

Newsgroup: rec.radio.amateur.space
Date: 1994-01-11 16:36:09 UTC
From: "F. Kevin Feeney" <fkf1@cornell.edu>
Message-ID: <2gukhpINNr5f@newsstand.cit.cornell.edu>
Source record: 28291

Hi,

Our club is interested in making NASA select video
of upcoming shuttle missions available to hams
via the local ATV repeater. We've got a station
with a satellite dish who can get the signal
direct, and we have him equipped with an ATV
station now, but we need some specific info on
the related rules. (we're also thinking of putting
the audio on the local 440 repeater - trying to
have a UHF appreciation week to get the activity
levels up)

What we think we know is this. We *think* its legal
to retransmit any of the SAREX missions and that
NASA has given blanket permission for these
retransmissions to occur.

We don't know if it is ok to retransmit shuttle
coverage of non-sarex missions.

We don't know if we need specific permission from
NASA to do anything. (we might call and get it
anyway just to be sure)

We don't know if we can retransmit tapes of past
missions (such as highlights of the last mission
with Hubble).

We've all scrounged around to see what we have for
rulebooks and the best is 1992 so far. And we don't know
what rules affecting this might have changed with the
recent rewrite of part 97. In reading that, it seems
that since it's not prohibited, we can go do it. Just
like to do a little checking beyond that.

Any help or useful comments appreciated.

Thanks,

Kevin, WB2EMS

I recently came across an article in another newsgroup that quoted a NASA report about the Mars Observer disappearance and one item caught my attention:

>> ... Mars Observer had turned off its transmitter as a
>> precautionary measure to protect the transmitter tubes from shock
>> just before it pressurized its onboard propellant tanks on August
>> 21. ...

Do they use vacuum tubes in spacecraft transmitters? I understand that tubes are more radiation-resistant than semiconductors, that they would be in a near-perfect vacuum in space, etc., but I'm still surprised. Does anyone have any info on this?

Enquiring minds want to know.

Thanks.

Mark

They used tubes because at the time they designed it, vacuum tubes that could provide the needed power output at microwave frequencies were cheaper and more reliable than comparable semiconductors. In fact, power microwave semiconductors are still kind of expensive, at least in small quantities.

I believe they still use TWTs because of their superior frequency/output
power rating - I guess vacuum
devices still cant be beat for some applications - I'll bet you probably
have one in front of you right now :)

Well, once it's out in space, it wouldn't need the glass envelope anymore.

I don't think expense was the reason. It was radiation hardness,
primarily (and vacuum tubes are a LOT more reliable in space than
semiconductors, so you wouldn't have to use as many backups).

I recall one of the Voyager spacecraft had to be operated
with the power to the onboard computer REVERSED for a period, in order
to correct some radiation-induced degradation. Yes, that's right:
they hooked up the computer to the wrong polarity of power, deliberately.

I dunno where I read the information about vacuum tubes, but yes,
I have read that NASA uses tubes for exactly the reasons you specify.
Tubes are resistant to the various forms of radiation in space.
And tubes do not need envelopes ... the vacuum of space is better
than the vacuum in any vacuum tube ever used on Earth.
====
Still, I think that not enclosing the tubes in something is kind of
dumb 'cause any gases vented by the spacecraft will continue to travel
along with the spacecraft and degrade the vacuum around the tubes.

They're called traveling wave tubes (twt) that's the best way of generating
power at microwave frequencies. Varian and Hughes Aircraft make most of them.

Vacuum tubes used in spacecraft still use envelopes. Since testing is required
on the ground, the tubes would be non-functional!

Also, radiation hardness is a minor concern, otherwise tubes would also
be used in the onboard computers!

The primary tube that is still used is the TWT, or Traveling Wave Tube. It
is used for high power, higher frequency microwave amplifiers. I believe
that communications satellites widely use them.

At least as of a couple years ago...
Several shuttle onboard computers made by IBM use magnetic core memory
("beads and string") which limits the range of windspeeds that can be
accomodated at liftoff.

But is anyone suprised that 1960s technology is used on the shuttle;
I'd hate to guess at how much of the design is on Hollerith cards.

I use a FT790R on all the digital ham satellites with no tuning problems. The method that I use for tuning the 9600 baud birds in FM (UO-22, KITSAT,...) is to program into one of the channel memories the center frequency of the bird. For sat freqs that are not on the channel spacing that is available for tuning in the FM mode, I put the radio in the USB mode and tune in the proper channel frequency and then program the frequency into the channel memory. The channel memory (at least on my FT790R, maybe not so in your MK2...not sure) does not control the radio mode. You can then select the center frequency for the 9600 baud bird by selecting the proper memory channel, select the mode by the mode control knob and then do doppler correction by enabling the clarifier which will allow you to tune up and down 10 KHz from the channel memory frequency. The maximum doppler frequency shift that you would ever see on Mode J (435 MHz down) would be 9.8 KHz maximum. I use a TRAKBOX satellite control unit that is made here in the states which allows both rotor and radio frequency tuning control. It provides an up/down frequency control option to center satellite signals in the downlink reciever IF for optimum signal detection. My FT790R using the clarifier to provide incremental frequency control works perfectly with TRAKBOX for me. I hope this helps. Let me know if you have any questions about what I've described here.

Good luck.
Ned Stearns AA7A

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It is
published every week and is made available for unlimited distribution.

* SUN AND MOON KEPS *
====================
By popular demand, here are Keplerian element sets in the NASA 2-line
format that will allow some satellite tracking programs to track the sun
and moon:

SUN
1 00001U 90 1.00000000 0.00000000 00000-0 0 3
2 00001 23.4406 0.0000 0167133 282.7685 357.6205 0.00273778 19890
MOON
1 00002U 93360.00000000 0.00000000 00000-0 0 5
2 00002 22.4297 346.9573 0408130 180.3337 265.5319 0.03574900304251

Caution should be exercised when using these element sets for several
reasons. First of all, these elements will cause some programs to crash
or produce erroneous outputs due to the unusually low values of mean motion
(and correspondingly high values of semi-major axis). Secondly, satellite
tracking software ignores satellite mass since their mass is negligible when
compared with the Earth's mass. The situation is not as simple when
tracking massive objects such as the sun or moon. In addition, the rising
and setting times for the sun and moon are defined by edge of the visible
disk, whereas the elements presented above track the center of the disk.
Effects due to atmospheric refraction could result in additional errors in
the prediction of local rising and setting times.

* STS-58 ORBITAL DATA *
======================
The following Keplerian orbital data set is valid for an on-time launch
of 24-Jan-94 at 14:53 UTC:

Satellite: STS-58

Epoch rev: 2

[Info via Gary Morris, KK6YB]

* SUPERBALL HAS THREE-HOUR LIFE *
==========
Some days go better than others. Superball 1-94, the balloon carrying amateur radio telemetry and ATV had a life of about three hours. Here is a report for those who were following the event.

Launch took place Friday, January 7, at 0926 MST (1626z). Final payload checkout was done, the amount of helium required for 120,000 feet was metered in, and the launch took place with all systems looking good. The balloon headed northeast as expected. Telemetry was copied on both 2 and 15 meters, and ATV sent back video of the balloon.

The balloon began to change course, as expected, as it came out of the Troposphere and reached higher layers. At about 1204 MST (1804 UTC) the balloon unexpectedly burst. A quick drop in the differential pressure (difference between inside and outside pressures) from 1.11 to 0.03 was one of the first clues that something had changed radically. Hams in eastern Utah actually watched the rupture on ATV and later saw the parachute deploy. GPS readings stabilized at about 1430 MST (2130z), and the package is believed to have come to rest at that time.

Telemetry on 15 meters was copied in Ohio with an RST of 579 after the package came to rest. This leads to the inference that it probably landed in a tree with the 15-meter antenna in a favorable position. The landing site is in Utah's Uinta Mountains in the neighborhood of Wolf Creek Summit, a 9500-foot pass. Plans were made to locate and retrieve the payload with the help of snowmobiles and the Wasatch County Search and Rescue Team.

The reason for the rupture is still uncertain, but one possibility is that turbulence in the troposphere caused severe twisting and kept the balloon from unfurling properly as it gained altitude. This, in turn, kept the helium from spreading through the balloon properly and resulted in too high a differential pressure. The twisting phenomenon was viewed on ATV.

The GPS receiver performed well reporting latitude and longitude, but apparently satellite geometry was not favorable for good altitude readings. The initial altitude readings were spurious (e.g. 149 meters, which is below ground level in Utah). Later the altitude was reported as "999" which is the receiver's indication that good data is not available. Other

indications, however, lead the team to believe that the balloon had reached an altitude of about 100,000 feet at the time of rupture.

Thanks to the many who helped copy data, relay messages, locate snowmobiles, and record launch and ATV video.

Telemetry logs and video tapes are solicited. E-mail to: WB7QBC@uugate.aim.utah.edu, or or U.S. mail to:

* FO-20 OPERATION SCHEDULE *
==========
The FO-20 operation schedule is follows. Analog transponder and digital transponder will be ON for a week respectively as they were since last December.

Analog mode:
12-Jan-94 07:30 UTC -to- 19-Jan-94 07:50 UTC
26-Jan-94 08:20 UTC -to- 02-Feb-94 06:50 UTC
09-Feb-94 07:15 UTC -to- 16-Feb-94 07:40 UTC
23-Feb-94 08:05 UTC -to- 02-Mar-94 06:40 UTC
09-Mar-94 07:05 UTC -to- 16-Mar-94 07:30 UTC
23-Mar-94 07:52 UTC -to- 30-Mar-94 08:15 UTC

Digital mode:
Unless otherwise noted above.

i can vouch for that. i've seen the core sheets. i still have a vial of the raw core; looks like iron filings, theyre so small. ibm has a peculiar habit of taking an antiquated technology to the limit. look how much mileage they got out of their tso/mvs 60's era operating system. thats the one where you have to manually allocate disk tracks before saving a file. millions of corporate customers around the world think this is the state of the art in modern computer equipment, mostly because ibm says so.

Revision: 1.5 12/18/93 14:15:53
Changes: new mailing lists, .packet rmgroup, and .policy updates

(Note: The following is reprinted with the permission of the author.)

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info,
and rec.radio.swap newsgroups. It is intended to serve as a guide for the new
reader on what to find where. Questions and comments may be directed to the
author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@oac.hsc.uth.tmc.edu. This message was last changed on 18 September
1993 to add the mailing lists for the new rec.radio.amateur newsgroups, to
note the rmgroup of rec.radio.amateur.packet, and to officially retire some
(in)famous threads of discussion on rec.radio.amateur.policy.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

As the net grew, and as packet radio came into vogue, packet discussion began
to dominate other topics in the group and on the list. This resulted in the
logical solution: a group was created to hold the packet discussion, and
another corresponding mailing list was created as well: net.ham-radio.packet
and PACKET-RADIO, respectively.

These two groups served for several years, and went through Usenet's Great
Renaming essentially unchanged, moving from net.ham-radio[.packet] to
rec.ham-radio[.packet]. Readership and volume grew with the rest of the
network.

The INFO-HAMS mailing list was originally run from a US Army computer at
White Sands Missile Range, SIMTEL20. There were few problems with this
arrangement, but one was that the system was not supposed to be used for
commercial purposes. Since one of hams' favorite pastimes is swapping
gear, it was natural for hams to post messages about equipment for sale
to INFO-HAMS/rec.ham-radio. This ran afoul of SIMTEL20's no-commercial-use
restriction, and after some argument, a group was created specifically
```

for messages like that: rec.ham-radio.swap. This group wasn't gatewayed to a mailing list, thus avoiding problems.

While all this was happening, other folks wanted to discuss other aspects of the world of radio than the personal communications services. Those folks created the rec.radio.shortwave and rec.radio.noncomm newsgroups, and established the precedent of the rec.radio.* hierarchy, which in turn reflected Usenet's overall trend toward a hierarchical name structure.

The debate between proponents of a no-code ham radio license and its opponents grew fierce and voluminous in late 1989 and 1990. Eventually, both sides grew weary of the debate, and those who had not been involved even more so. A proposal for a newsgroup dedicated to licensing issues failed. A later proposal was made for a group that would cover the many recurring legal issues discussions. During discussion of the latter proposal, it became clear that it would be desirable to fit the ham radio groups under the rec.radio.* hierarchy. A full-blown reorganization was passed by Usenet voters in January 1991, leading to the overall structure we now use.

After the reorganization, more and more regular information postings began to appear, and were spread out across the various groups in rec.radio.*. Taking the successful example of the news.answers group, where informational postings from across the net are sent, the group rec.radio.info was created in December, 1992, with Mark Salyzyn, VE6MGS, initially serving as moderator.

In January, 1993, many users started complaining about the volume in rec.radio.amateur.misc. This led to a discussion about a second reorganization, which sparked the creation of a mailing list by Ian Kluft, KD6EUI. This list, which was eventually joined by many of the most prolific posters to the ham radio groups, came up with a proposal to add 11 groups to the rec.radio.amateur hierarchy in April 1993. The subsequent vote, held in May and early June, approved the creation of five groups: rec.radio.amateur.digital.misc (to replace .packet), .equipment, .homebrew, .antenna, and .space.

The Current Groups

I can hear you asking, "OK, so this is all neat history, but what does it have to do with me now?" The answer is that the history of each group has a direct bearing on what the group is used for, and what's considered appropriate where.

The easy one is rec.radio.amateur.misc. It is what rec.ham-radio was renamed to during the reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize

this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, should be removed by September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is now rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there.

The first reorganization added two groups to the list, one of which is rec.radio.amateur.policy. This group was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The other added group is rec.radio.cb. This is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently Mark Salyzyn, VE6MGS. The email address for submissions to the group is rec-radio-info@ve6mgs.ampr.ab.ca. Inquires and other administrivia should be directed to rec-radio-request@ve6mgs.ampr.ab.ca. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas,

commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

I remember reading somewhere that the original shuttle designers were given a choice by IBM. IBM said something like "we can use this existing, space rated hardware (core etc), or do a new design. The new design will take longer." The shuttle designers didn't want the shuttle delayed and told IBM that. So here we are -- even though other delays in the shuttle program added a few *years* to first shuttle flight.

I'm sure none of us armchair designers would bother to consider that
core memory is considerably more immue to radiation induced errors
than semiconductor memory while we're re-designing the shuttle system,
which operate in a region of considerably higher ambient radiation
levels than on Earth...

Yes, I was thinking about that. I remember reading, not six years ago, about _new_ core memory products designed to be used in automatically assembled PC boards, with simple TTL interfaces to microprocessors and all the other things we expect these days. They were fantastically expensive and invariably rated for military temperature ranges. Their intended use was radiation-hardened electronics.

I'm skeptical radiation is the reason behind core on the shuttle. I'm also not sure the shuttle still uses core. I've read that among the post-Challenger changes, the shuttles were equipped with modernized computers with substantially more memory. You tell me what that means (the popular press is never too specific). It could be it's just more core, or perhaps it has moved up to semiconductors.

Which in this case was exactly what NASA wanted. SEUs are a problem with any solid state memory device. Core doesn't suffer from SEUs. It also has the charm of being non-volatile so the computers can be powered down when not in use for power saving, yet still be loaded and ready to execute when powered back up. Core is a perfectly good technology if you don't need vast amounts of RAM, and Shuttle doesn't. Core didn't set a speed limit on Shuttle computers, the slow bit slice parts, and the need to *vote* on every command did that. Man rated flight systems can't be allowed to lock up, core dump, or issue fraudulent commands to the flight hardware. At the time Shuttle was designed, there was nothing more reliable than core available. There still isn't, but ECC washed memory can suffice if care is taken. Ordinary microprocessors can't be trusted either since their registers and on board caches are subject to SEUs.

Oh boy! As a dedicated IBM-basher, this is painful, but let me remind
all you technocrats that the environments spacecraft operate in are
quite hostile indeed to solid-state CMOS devices. This is not IBM's
doing,they have simply taken a proven technology, albeit old and
perhaps outdated for terristrial use, and applied it to the VERY
hostile environment of space.

The core memeroy has several advantages over solid-state, not the
least of which is that if power is lost, for whatever reason, the
memory holds whatever settings it had...for longer than a UPS will
hold CMOS... Hollow-state is not suseptible to Ultra-violet erasure,
nor to EMP erasure...sure it takes very different designs, and has
limits that silicon technology does not, but it works in a very
hostile environment, and that is why it is used, NOT because IBM says
it should -- the equipment was SPEC'ed that way!

Ooooh.... that hurt me to type! ;^)

> they got out of their tso/mvs 60's era operating system. thats the one where

And here I can breath again, because what has been typed is so: MVS
was a pig, and the choices exercised by it to allocate resources were
following an easier path... however, as any gray-flannel three-piece
suiter will tell ya: "No consultant ever got fired for recommending
IBM..." (Unless it was to Honeywell (BULL), Sperry, Burroughs, or
DEC ;^)

OK, so how susceptible to SEUs are normal computer hardware? I know I have seen pictures of the astronauts using regular laptop computers on the shuttle to their normal work. They obviously are not controlling the flight hardware with them, but if I took a notebook computer with me on the shuttle, how often should I expect it to crash or output bad data?

AMSAT-NA OPPOSES FCC "INSTANT LICENSING" PROPOSAL

AMSAT-NA has filed comments with the FCC in opposition to the "instant licensing" proposal contained in a Notice of Proposed Rule Making, PR Docket 93-267. Under the FCC's proposal, unlicensed persons who pass an amateur license examination for the first time would immediately be permitted to operate for up to 120 days, using self-assigned call signs, while waiting for their licenses to arrive.

In its comments, AMSAT-NA cited the potential for abuse by persons who may never have had any intention of taking an examination, as well as the impossibility of verifying the self-assigned calls since they would not be registered in any database. The "guaranteed anonymity" of a self-assigned call sign system would, in AMSAT-NA's words, multiply the potential for interference by unlicensed persons with amateur radio operation. This is particularly relevant to the Amateur-satellite service, AMSAT-NA went on to say, because the 2M, 10M and 70CM bands, which presently contain the most popular satellite uplinks and downlinks, are also among the most likely to be affected by such interference. The international nature of satellite operation means that problems could be caused for amateurs, and govern-mental authorities, in other countries as well as in the United States.

As an alternative to "instant licensing," AMSAT-NA urged the FCC to pursue the use of electronic filing and processing of amateur license applic-ations. AMSAT-NA's comments in PR Docket 93-267 generally paralleled those of ARRL, with special emphasis on the problems which would be caused for the Amateur-satellite service.

LO-19: Operating normally. [WH6I]

KO-23: Up and running. Busy as usual. [WH6I]

PoSAT: Appears to still be on it's commercial frequency. There was a
message regarding amateur service that indicated it will be on
amateur frequencies at the end of the month. [WH6I]

ITAMSAT: On 1200 Baud, currently collecting WOD data. A note on the bird indicates that the BBS will return to operation soon. [WH6I]

MIR: Cosmonauts Vasili Tsibliev and Alexander Serebrov returned Friday, 14-JAN-94, to Earth after six months in space on-board MIR Russian space station. The TM-17 Soyuz spacecraft landed at 08:18 UTC in Karaganda. The two cosmonauts have been in space from 01-JUL-93. The Personal Messaging System (PMS) on-board MIR continues working under the callsign R0MIR-1, operated by the actual crew that arrived last Saturday in TM-18 Soyuz. [LW2DTZ]

The AMSAT NEWS Service (ANS) is looking for volunteers to contribute weekly OSCAR status reports. If you have a favorite OSCAR which you work on a regular basis and would like to contribute to this bulletin, please send your observations to WD0HHU at his CompuServe address of 70524,2272, on INTERNET at wd0hhu@amsat.org, or to his local packet BBS in the Denver, CO area, WD0HHU @ W0LJF.#NECO.CO.USA.NOAM. Also, if you find that the current set of orbital elements are not generating the correct AOS/LOS times at your QTH, PLEASE INCLUDE THAT INFORMATION AS WELL. The information you provide will be of value to all OSCAR enthusiasts.

/EX

I spend a lot of time testing for radiated immunity (and radiated emissions) problems on microprocessor-based instruments. Semiconductor memories generally do not have immunity problems with radiated fields. Besides, there's hardly an EM immunity problem that a Faraday cage can't solve if you can constrain your system to operate in one. Memory and CPU certainly fit in that category. Actually, most often they ARE caged to constrain the EM energy their clocks produce. This radiated energy doesn't bother them, but rather interferes with radio recievers and small signal transducers.

The statement about ambient radiation being higher in space than on earth is confusing. To what radiation are you referring? Cosmic? Transmitters (intentional and otherwise) are responsible for nearly all the EM fields in the frequency range that can induce unwanted currents in circuits and the farther you are from the source, the smaller they are.

We're talking about *ionizing* radiation. (Ionizing) radiation
resistance is an important design spec even in low earth orbit (LEO).
The shuttle passes through or near the South Atlantic Anomaly on most
flights.

I (devlin@lf.hp.com) wrote:

: Richard Feynman discussed this in his excellent book _What_Do_You_Care
: What_Other_People_Think_.

: For those of you who don't know Feynman, he was the Nobel Prize-winning
: scientist that was part of the commission that investigated the
: Challenger accident. I was amazed to read that something as
: sophisticated as the shuttle would use something as antiquated as core
: memory. However, the shuttle's control software represents a large
: development investment and parts of it are borrowed from previous
: generation space programs. It also been thoroughly tested and therefore
: prohibitively expensive to change. That's why they're stuck with ancient
: hardware with which to run it.

I realize it is anathema to provide sources in a forumn that thrives on
speculation, conjecture, and hearsay but I'm going to go even further
since this will otherwise turn into a 'string that will not die'

Please forgive me for I'm about to do the unthinkable. I'm actually
going to quote from the book I referenced above. Remember, this man was
a Nobel prize-winning physisist who had inside access to the shuttle
development personnel during the investigation of the Challenger.

From page 192 of _What_Do_You_Care_What_Other_People_Think_:

"Although there's a lot of good software being written at Johnson, the
computers on the shuttle are so obsolete that the manufacturers don't
make them anymore. The memories in them are the old kind, made with
little ferrite cores that have wires going through them. In the
meantime we've developed much better hardware: the memory chips of
today are much, much smaller; they have much greater capacity; and
they're much more reliable. They have internal error-correcting codes
that automatically keep the memory good. With today's computers we
can design separate program modules so that changing the payload
doesn't require so much program rewriting.

Because of the huge investment in the flight simulators and all the
other hardware, to start all over again and replace the millions of
lines of code that they've already built would be very costly."

(There's a lot of associated information that discusses how each mission
is flown on simulators using the same software before the actual mission.)

So all of you core memory apologists can give it rest now. I think it's
pretty clear from the above excerpt that the core memory is a vestige of

the shuttle's past. It is not required for its alleged reliability or immunity to extraterrestrial electromagnetic events.

There's a lot of great information about the shuttle program in the book. I believe someone mentioned in an earlier posting that the shuttle doesn't need much memory and that's why core is acceptable. Here's why that's not correct:

From page 190:

"The shuttle's computers don't have enough memory to hold all the programs for the whole flight. After the shuttle gets into orbit, the astronauts take out some tapes and load in the program for the next phase of the flight -- there are a many as six in all. Near the end of the flight, the astronauts load in the program for coming down.

The shuttle has four computers on board, all running the same programs. All four are normally in agreement. If one computer is out of agreement, the flight can still continue. If only two computers agree, the flight has to be curtailed and the shuttle brought back immediately."

If memory requirements really were minimal, it wouldn't be necessary to be carrying all those tapes along.

While I'm at it, I should also mention that the shuttle astronauts have taken the HP41C calculator with them and gave it good reports for its reliablity. And no, it doesn't use core memory :-).

We're not talking about RF. We're refering to *ionizing* radiation. This
causes ionized paths in the substrate of ICs that can cause flipped bits.
These effects are generally temporary, hence *single* event upsets, but
cummulative damage can be permanent, and the stray heavy nuclei can cause
permanent stuck bits.

The Shuttle stays in a low enough orbit to receive considerable protection from radiation via the Earth's magnetic field, but it does pass through the SAA on most missions, and the radiation flux is higher there. Satellites that pass through the Van Allen belts get a real dose, and high intensity cosmic rays are a continous problem. If you look at the telemetry from the amateur satellites, you can get a good idea of the frequency of SEUs. Without ECC memory, the average laptop would likely suffer a flipped bit one or more times a day. If that bit is in an active area of program memory, you may have a crash. If it hits the stack, you'll almost certainly have a crash.

Feynman was a visionary physicist, a great teacher, and a wonderful
populariser of science, but he was not a computer systems reliability
engineer. He's commenting outside his field here.

It's unsurprising that Shuttle computers aren't made anymore. They were
special built for the Shuttle, and we aren't building any more Shuttles.
However, the Shuttle computers have recently been upgraded, and three
of the four now do use some ECC memory for non-critical data storage.
ECC is *not* proof against SEUs, but it's much better than unprotected
memory. ECC can protect against single bit errors, and most double bit
errors, but a triple hit and it's game over. Core doesn't care.

>be carrying all those tapes along.

There's no good reason to have the entire software load for the entire flight profile in the computer at once. Loading in the proper programs at the proper time from tape is perfectly acceptable. Does your computer keep every bit of software you use in memory at all times? Of course not. That's why we have hard disks. However, hard disks aren't that sturdy when subjected to launch vibration and G forces, so Shuttle uses tape instead for program storage.

Note, Apollo used the HP-35 calculator as backup for it's computers, so the necessary data loads aren't that large. Shuttle carries the HP-41CV as an ultimate backup to it's computers. If all four main computers fail, the pilot can manually calculate trajectories with it's aid. Naturally it isn't as robust as the normal computers, but it's better than nothing, and takes up little mass or volume.

Note also that program bloat can be traced almost completely to having excess RAM available. Programs naturally expand to fill the space available, witness Wordstar. It was a great fast program on a 48 kb Z-80 system, but now it's a multi-megabyte dog on a Windows PC with 8+ megs of RAM. And that's 166 times more RAM to develop a bit error that can crash the system. To a large degree, reliability is a function of parts count. The fewer parts, the less to go wrong.

Most IBM PC clones have just a parity check. No ECC. Unless a chip is bad,
you almost never see a memory fault.

Use of ECC protected memory is much more common in minis and larger
machines.

From: k9jma@cbnewsc.cb.att.com
Message-ID: <CJs81u.68p@cbnewsc.cb.att.com>
Source record: 28330

I've had a lot of fun on RS-10 and so have been working on getting set up for other satellites. Thought to try FO-20 mode JA next since it is a low orbit satellite like RS-10 and so the only additional equipment needed should be a 435 MHz receiver. Expected to be able to use simple omnidirectional antennas like for RS-10 but it doesn't seem to be turning out that way.

Can't copy the FO-20 downlink or beacon at all with just a "J" and R-7000 (with fair MRF901 2db NF preamp) - had to use the crossed Yagis intended for mode B uplink to AO-13 to get solid copy!

For 146 MHz uplink the 60 Watts into a "J" that gets me a 569 RS-10 mode A downlink doesn't produce any audible FO-20 mode JA downlink. Had to use crossed Yagis intended for mode B downlink for AO-13 to produce passable results.

Use of gain antennas for LEO satellite is a pain with my "armstrong" rotator system. (Power rotators and automated tracking wouldn't be necessary for AO-13 and I hope to avoid the effort if I can.)

So, it seems that it takes about 10db more "effort" than I had expected on both up and down links. Comments from other FO-20 users on whether my results are consistent with their experience would be greatly appreciated.

Thanks and 73 de Ed K9JMA

I don't think you have to worry about the vented gases traveling with the spacecraft for any appreciable length of time and thus spoiling the vacuum. Any unconfined gas in the vacuum of outer space will expand outward at an extremely high rate of speed. In fact, each individual gas molecule will travel more or less indefinitely (i.e., until it runs into something) in a straight line with whatever speed and direction it happened to have when it cleared the vent port.

> Frequently Asked Questions about the Space Shuttle computers
> --
>
> Every few weeks, someone on sci.space.shuttle asks about the
computers used
> on the shuttle. Since I used to be intimately involved with flight
software,
> I decided to create a FAQ list for this topic.
>
> This FAQ is a personal effort on my part. It is not blessed by NASA
or my
> employer. The data in here was collected during several years of
working in
> the flight software arena. If you believe any part of this document

is in
> error, contact me and I'll try to resolve the issue thru further
research.
>
> 1) What kind of computer does the shuttle use?
> All of the flight-critical software is executed on five IBM
AP-101 General
> Purpose Computers (GPCs). The crew may use commercially
available laptops
> and programmable calculators for non-critical applications.
>
> The AP-101 is a descendant of the IBM 360/370 family that was
specially
> redesigned for use on the shuttle. By today's standards, the
AP-101
> is incredibly slow. The original AP-101B version is being
replaced by
> an updated AP-101S. The new version is still nowhere close to
state
> of the art, but it is an improvement none the less.
>
> 2) Tell me more about the GPCs
> The AP-101 is a very different computer than what most people are
familiar
> with. Like most computers used in aerospace applications, it
does not
> have a keyboard or CRT. It is a black box with chips and a power
supply.
>
> Relax - there *are* keyboards and CRTs available for the crew,
but they
> aren't considered part of the GPC. In fact, there isn't even a
one-to-one
> correspondence between computers and keyboards. Any CRT or
keyboard can
> be addressed by any GPC, depending on the state of cockpit
switches.
> BTW, the keyboards aren't your typical QWERTY keyboard. They are
a funky
> hexadecimal keypad with several special-purpose function keys.
>
> Besides the CPU, the GPC has twenty-five (25) additional
processors.
> All of the processors besides the CPU are dedicated to I/O.
There is one
> processor for each of the twenty-four serial data busses the
AP-101 uses
> to control and monitor the vehicle.
>
> Each of the I/O processors can be programmed independently to

handle
> incoming/outgoing data transfers for its respective data bus. The
> twenty-fifth processor is a master I/O scheduler. It serves as an
> interface between the CPU and the other I/O processors.
>
> The use of truly independent I/O processors allows the CPU to
concentrate
> on number-crunching and not get bogged down with I/O. This is
very
> important considering the hard real-time requirements the
software must
> meet.
>
> 3) How much memory do the GPCs have?
> The amount of memory available in the AP-101B is 212,992 16-bit
words.
> The AP-101S holds up to 524,288 words. Yes, this is ludicrously
small
> by today's standards. These numbers do not include error
detection bits.
> The memory in the AP-101B is honest-to-gosh ferrite core. The
AP-101S
> uses normal RAM.
>
> 4) How big are the GPCs?
> The original AP-101B consists of two 64 pound boxes, each of
which
> are 36"x12"x12" (approximately). One of the two boxes is the CPU
and
> most of the memory. The other box houses the 25 independent IO
processor
> chips and the rest of the memory. The AP-101S is housed in one
similarly
> sized box.
>
> 5) OK, so now I know what a GPC *is*. What does it *do*?
> The shuttle is a fly-by-wire vehicle (like the F-16). This means
that
> there are no direct connections between the cockpit controls and
the
> vehicle. Every switch and every button is connected to the
computers.
> The engines, SRBs, flaps, payload bay doors, etc are all
controlled by
> the software.
>
> The entire flight, from pre-launch to roll-out, is under computer
control.
> This isn't to say that the crew is unnecessary. They are needed,
but

> the software is between them and everything they do.
>
> When the software detects a change of state in a switch, it
determines
> what that switch is used for, what the new state means, and if
the command
> is legal at this time. Once it has done all that, then the
software will
> issue the appropriate command via the serial data busses.
>
> An example - If the commander wants to push the nose down during
flight,
> he pushes the forward on the joystick in front of him. The GPC
reads this
> input, determines what it means, and then issues commands to the
proper
> control surfaces. These commands are electronic signals that go
to an
> actuator. The actuator is what actually moves the aero-surface.
Depending
> on the actuator, it may use hydraulics or an electric motor to
move the
> surface.
>
> It is very important to realize that the shuttle is completely
fly-by-wire.
> If the flight software fails to operate, the vehicle will crash.
Period.
>
> 6) Can the astronauts override the software?
> Yes and no. Yes the astronauts can override decisions made by
the software.
> But the mechanism used to perform the override is in SOFTWARE!
Do you see
> the catch? If the software is fouled up badly enough, the
override won't
> work.
>
> 7) Why five computers?
> Redundancy. Every aspect of the shuttle is designed with
redundant
> systems (when possible). The goal of the shuttle is to withstand
any
> two failures and still maintain crew safety. This goal is met
with
> very few exceptions. For the computer system, there are two
levels of
> redundancy. The first level of redundancy is thru the use of
multiple
> computers running the same software. The second level is thru

the use
> of two completely independent sets of software.
>
> The five General Purpose Computers (GPCs) are all running
simultaneously
> during flight. Four of them are running the Primary Avionics
Shuttle
> Software and one of them is running the Backup Flight Software.
During
> normal flight, the four PASS machines run the exact same
software, using
> the exact same inputs. Each of the four has equal responsibility
for
> controlling the vehicle. If any of them fail, the others will
override
> it and the vehicle is still safe.
>
> If the four PASS machines have failed for some reason (hardware
or
> software), the crew can engage the Backup Flight Software.
During normal
> flight, the BFS is running, but the settings of certain hardware
switches
> prevent it from taking control of the vehicle. After BFS engage,
this
> changes - the 4 PASS machines are prevented from issuing commands
to the
> vehicle and the BFS machine is now in full control.
>
> 8) How does the crew engage the Backup Flight Software?
> The Commander and Pilot each have a bright red switch located
prominently
> in front of them on their Rotational Hand Controller (joystick).
At any
> time during flight, either or both of them can depress this
switch. At
> that time, an irreversible process begins.
>
> Some special purpose boxes called Backup Flight Controllers
detect this
> event and turn certain discrete signals to the GPCs off or on.
These
> hardware signals are what actually allow any given GPC to issue
control
> commands to the vehicle.
>
> Within 40 milliseconds, all of the PASS computers will be
disabled from
> sending commands to the vehicle and the BFS computer will be in
control.

> Other than some changes on the CRTs, the transition to BFS is
mostly
> transparent.
>
> Unfortunately, there is a small (very small) chance that the
transition
> from PASS to BFS will not succeed. That is, the PASS machines
will be
> disabled AND the BFS machine will be disabled. If this happens,
the
> vehicle will be uncontrolled and uncontrollable. The odds of
recovering
> from this scenario are vanishingly small. For this reason, the
crew will
> avoid engaging BFS as long as possible.
>
> 9) Who wrote the software and what language is it in?
> The PASS was written by IBM Federal Systems Division. Most of it
is
> written in an obscure language called HAL/S and some of it in
assembly.
> HAL/S is something like a cross between Pascal and FORTRAN. It
has
> built in support for vector and matrix arithmetic. This is
useful since
> all guidance & navigation calculations make heavy use of these
structures.
>
> The BFS was written by Rockwell International and is mostly in
assembly.
>
> 10) What Operating System do the GPCs use?
> A proprietary one of course. :-) Seriously, the PASS and BFS
each have
> their very own custom designed OS. It ain't like nothin' else in
the world.
>
> 11) How is the software tested?
> Testing flight software is a multi-stage process. NASA has
several
> simulators (of varying fidelities) that are built around one or
more of
> the flight computers. This allows the tester to run the actual
flight
> software in real-time on a real computer.
>
> After a programmer changes a module, he tests that module on the
first
> level (lowest fidelity) simulator. If it behaves as expected, it
is given

> to the people who do integration testing.
>
> Eventually, an entire release of the flight software is delivered
to
> the Shuttle Avionics Integration Laboratory (SAIL). SAIL is the
best
> avionics simulator in the world. It uses real flight-ready
hardware
> tied into environment simulators. That is, it has 5 real GPCs, 3
CRTs,
> real multiplexers, etc. A full-up simulation in SAIL has an
astronaut
> in the simulator cockpit and about 30 engineers at various test
stations
> supporting the effort. The SAIL is capable of simulating all
phases of
> Shuttle flight. It is the final arbiter of whether or not the
software
> is ready to fly.
>
>
> 12) Why doesn't NASA use more modern computers?!?!?!?!
> This issue really bugs a lot of people. A $2000 486 PC is quite
a bit
> faster than the AP-101 and can hold a whole lot more memory. So
why
> doesn't NASA yank out the AP-101 and stuff in a PC?
>
> There are several reasons - reliability, certification, and
performance.
>
> Reliability - The AP-101 has been built to withstand extremes in
> temperature, vibration, radiation, etc. PCs aren't.
>
> Certification - Before ANY piece of hardware is allowed on the
shuttle,
> it has to undergo extensive testing. Does the case release toxic
fumes
> if it catches on fire? Does it operate the same in zero-G as it
does on
> Earth? How about at 3-G? Are there sharp edges that can cut
anything?
> Is it compatible with the orbiter's power system? There are
thousands
> of questions like this. For a complex piece of flight-critical
hardware,
> the certification process can take millions of dollars. For
example,
> the upgrade from the AP-101B to the AP-101S took several years
and untold

> millions of dollars. And this was for an UPGRADE! Can you
imagine how
> much longer it would take for a completely new design?
>
> Performance - It is not clear to me that even a fast 486 could
meet the
> real-time requirements for the shuttle flight software. The GPCs
have
> to process a LOT of input data. If it fails to provide an output
on time,
> very bad things could happen. The use of multiple processors in
the GPCs
> is something a PC just can't compare with.
>
> Besides the issues of reliability, certification, and
performance, there
> one more very good reason to stick with the current computers.
They work!
> Yes, they're old and slow and new computers are "better". So
what? The
> current setup does the job in an acceptable manner. If NASA had
infinite
> money, then replacing the GPCs could be justified. But right
now, there
> are other things the money could be used for.

Brad worked flight software issues before becoming a professional UNIX
Wizard. He works on-site at JSC in building 12, up on the second
floor, but I don't know what he's up to these days. I oughta go ask --
it's bound to be something interesting.

Well, that explains the dismal results this past weekend. I thought that
FO-20 would be a good next step after getting comfortable with RS-10; maybe
not.

Whatsa good-but-minimal FO-20 setup look like? I'd rather not have to push
my luck with the neighbors by setting up 10' crossed yagi's on 2-axis motors.

Hmmm, will they take an HP48 with them? That thing could probably run
the Shuttle for them. <bg> And double as a Game Boy! :)

On a related topic, it was mentioned in sci.space.shuttle once, during
last year's interminable shuttle launch aborts, that the Space Shuttle
Main Engine controllers used 68000's. Those can't possibly use core.
And as the Shuttle apparently passes through the Anomaly on its way
up, the controllers would be subject to SEU's, no? Sensor failures on
the engines, I've heard of; controller crashes, I have not. Why?

>Feynman was a visionary physicist, a great teacher, and a wonderful
>populariser of science, but he was not a computer systems reliability
>*engineer*. He's commenting outside his field here.

Feynman's job description at Los Alamos (working on
the first A-bomb) was 'Head of computation section', and his
last employment (at the time of his death) was with Thinking
Machines, Inc. While he is best known for his physics work,
his fast logarithm algorithm is also pretty widely respected.

He was NOT outside his field here. And, he wouldn't
care whether he was or not (you judge the ideas on their
own merits, not on the merits of their spokesmen).

Perhaps I am mistaken, but didn't the HP-35 calculator become available in 1972 ? Many of the Apollo flights (if not all) were over by then. Of course, there was still Skylab and ASTP, but I'm not sure that this is what you meant.

Hmm, "Seems to work OK every time we try it" versus "Guaranteed to work perfectly by the manufacturer under the conditions specified" are quite different. No way I'd want to take a ride with computers put together by the sort-parts-for-faster-than-specified-operation crowd, whose machines' testing is about as thorough as the HP's in this report.

Maybe the HP _is_ good enough to run the shuttle, but for something that critical I'd want some proof, both theoretical and experimental.

To continue to partially quote Feynman, while he thought the Shuttle's computer systems seemed crufty, he also admitted that they were the only major (read: extremely complex) subsystem of the Shuttle that _didn't_ have performance problems, and that worked exactly as designed. Maybe these rickety old computers are doing something right? (They may be a royal pain in the ass, but so long as they do the job right they've got a lot going for them.)

>At least as of a couple years ago...
>Several shuttle onboard computers made by IBM use magnetic core memory
>("beads and string") which limits the range of windspeeds that can be
>accomodated at liftoff.

I am fairly certain that these cores are not out in the wind. The shuttle was designed to a 2G acceleration limit and many of the bits are no stronger than 2G requires. The wings, which are out in the wind, are not strong enough to withstand the speeds implied by 2G acceleration from the ground.

Electronic items must be "space qualified" which is a lengthy process that insures less than leading edge technology. Space qualified parts must be fairly cosmic ray and radiation resistant which guarantees that some technology will never qualify for mission critical applications. Many manufacturers are not interested in making qualified parts because demand is rather limited.

I'm talking about atomic particles moving very rapidly; you know,
radioactivity like the kind produced by plutonium, or cosmic rays.
I'm not talking about EM radiation, like that produced by an radio
transmitter.

>The statement about ambient radiation being higher in space than on
>earth is confusing. To what radiation are you referring? Cosmic?
>Transmitters (intentional and otherwise) are responsible for nearly all
>the EM fields in the frequency range that can induce unwanted currents

Right; but, as explained above, I'm talking about things like alpha
particles and stuff like that. The Earth's atmosphere shields us
from a lot of the stuff from outer space. Find someone at HP who
works on electronics for satellites and ask them about rad-hardness.

From: tim.stephens@canrem.com
Message-ID: <60.1179.3291.0N191A59@canrem.com>
Source record: 28360

Hi Everyone.
I'd like to listen to the Russian MIR space station as well as the U.S. Space shuttles. I understand that MIR can be heard on 145.550, but I'd like some additional frequencies. :-)
I've been DXing for years, but I've usually limited myself to SW band stuff, so I really am new to the game of space listening. I'd be very appreciative if anyone might offer some advice on recommended receivers, frequencies, and any and all other tips you think a novice ought to know.
In addition, I'm interested in the video Xmitted by the shuttle and MIR--are any of you watching it? What equipment set up is required to see the video
I really appreciate any and all advice and comments.

Just a note. Alpha particles unless they are high energy solar won't go
through paper. Beta (electrons) won't make it through the shuttle
compartment except at monstrous temperatures (speeds). The only thing left
is the solar wind, shielded as we are in low orbit by the Van Allen belts,
and cosmic rays, which do pass all the way through the earth! Some of them!

The solar flux that is lower in velocity is responsible for most excess computer errors. Also, let us remember that the shuttle equipment may produce high DC magnetic fields from some equipment. These are NOT shielded by EM Faraday cages, and can go through even sheet steel! If you have some ferrite beads for memory, one good mag pulse can wipe them inside anything. But they are probably more immune or else better proven and reliable. I have a board out of a DEC that is 8K x 16 and it is 7" by 10" in area and I haven't the vaguest idea where they got the people to do all that under a microsope! They must have used #48 gauge wire!!! Can't even see the beads without a microscope!

The satellites you are receiving are weather satellites NOAA-10 and I think
NOAA-13. The audio you hear is the picture being transmitted. I have
a system connected to my PC to display this info. There is a book
called Weather Satellite Handbook by Dr. Ralph Taggart that
descibes this system. You can buy this book at a local Ham Radio
Store.

IPS RADIO AND SPACE SERVICES AUSTRALIA
Daily Solar And Geophysical Report
Issued at 2330 UT 19 January 1994
Summary for 19 January and Forecast up to 22 January
No warning is current.

1A. SOLAR SUMMARY
Activity: low

Flares: none.

Observed 10.7 cm flux/Equivalent Sunspot Number : 103/052

1B. SOLAR FORECAST
20 January 21 January 22 January
Activity Low to moderate Low to moderate Low to moderate
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number : 105/054

1C. SOLAR COMMENT
None.

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth : mostly unsettled with a minor storm
period during local night.

Estimated Indices : A K Observed A Index 18 January
Learmonth 19 3433 5233
Fredericksburg 19 21
Planetary 23 22

2B. MAGNETIC FORECAST
DATE Ap CONDITIONS
20 Jan 20 Unsettled to active.
21 Jan 20 Unsettled to active.
22 Jan 20 Unsettled to active.

2C. MAGNETIC COMMENT
Enhanced levels of geomagnetic activity are expected to persist
for next three days. This activity has been ongoing since 15UT on
the 11th January. A small isolated equatorial coronal hole is
visible at the centre of the solar disk. As this hole is small,
geomagnetic activity levels are not expected to increase beyond
current levels.

3A. GLOBAL HF PROPAGATION SUMMARY
LATITUDE BAND
DATE LOW MIDDLE HIGH
19 Jan normal normal fair-normal
PCA Event : None.
3B. GLOBAL HF PROPAGATION FORECAST
LATITUDE BAND
DATE LOW MIDDLE HIGH
20 Jan normal fair poor
21 Jan normal fair poor
22 Jan normal fair poor
3C. GLOBAL HF PROPAGATION COMMENT
Continuing geomagnetic activity at high and middle lats has degraded
hf propagation conditions recently. Degraded conditions are expected
to continue at high and middle lats over the next three days.

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
MUFs at Sydney were slightly below predicted monthly values

T index: 25

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
DATE T-index MUFs
20 Jan 20 About 10% below predicted monthly values.
21 Jan 20 About 10% below predicted monthly values.
22 Jan 20 About 10% below predicted monthly values.

Predicted Monthly T Index for January is 30.

4C. AUSTRALIAN REGION COMMENT
East coast propagation conditions may have been degraded yesterday
due to the regular appearance of Sporadic E layer and occasional
Spread F. Similar conditions are expected for today.

Really? The one or two CMOS chips that could replace the core memory could be backup-powered for at least a year by a lithium battery the size of a quarter..

UV erasure is not a problem if chips are packaged...

But hey.. it costs a fortune to replace that battery!

110. HELP:Trouble with TRACKSAT 3.00 !

Newsgroup: rec.radio.amateur.space
Date: 1994-01-20 22:43:57 UTC
From: gerca@lysator.liu.se
Message-ID: <CJy9tB.LAM@lysator.liu.se>
Source record: 28164

I need help with the following problem;

I have obtained the latest tle.txt file from the ftp server mentioned in the documentation. When I exchange the old file with the new one TRAKSAT hangs up and nothing is displayed except the mouse cursor, which still works, and the menu screen. I can't choose any of the menu alternatives. When I start TRAKSAT with the /x switch the program starts up but when I tree to read the TLE.TXT file it crashes and displays;

RUNTIME ERROR 6806 Can not read file !

Does anyone have a solution to this ?

Thank you in advance,

Gert E B Carlsson, SM5LWC

14 JANUARY - 20 JANUARY 1994

Issue No 03
Date of issue: 21 January, 1994

INDICES:
Date 14 15 16 17 18 19 20
10cm 090 096 100 105 101 103 105
A 18 18 14 23 21 21 (10)
T 63 42 11 41 59 25 29

SUMMARY OF ACTIVITY

January 14
Solar activity was very low.
The geomagnetic field at Learmonth (WA) was unsettled to active.
Ionospheric F2 critical frequencies at Sydney were slightly above
predicted monthly values.

January 15
Solar activity was very low.
The geomagnetic field at Learmonth (WA) was unsettled to active.
Ionospheric F2 critical frequencies at Sydney were near predicted
monthly values 00-10UT, subject to severe Sporadic E layer and Spread
F 11-18UT, and 10-20% depressed from 19UT onwards.

January 16
Solar activity was high, with an M6.1/1N at 2325UT.
The geomagnetic field at Learmonth (WA) was unsettled.
Ionospheric F2 critical frequencies at Sydney were up to 15% below
predicted monthly values, apart from Sporadic E layer blanketing
09UT, 13-17UT, and from 21UT onwards.

January 17
Solar activity was very low.
The geomagnetic field at Learmonth (WA) was mostly unsettled.
Ionospheric F2 critical frequencies at Sydney were blanketed by
Sporadic E layer 00-01UT, 08-12UT, 14UT, 16-18UT, and from 21UT
onwards. Near predicted monthly values at other times.

.SK
January 18
Solar activity was very low.
The geomagnetic field at Learmonth (WA) was mostly unsettled.
Ionospheric F2 critical frequencies at Sydney were 15-30% enhanced
00-02 and 04-09UT, and otherwise near predicted monthly values, apart

from Sporadic E blanketing 03, 10-11, 21 and 23UT.

January 19
Solar activity was very low.
The geomagnetic field at Learmonth (WA) was mostly unsettled with a
minor storm period during local night.
Ionospheric F2 critical frequencies at Sydney were slightly below
predicted monthly values.

January 20
Solar activity was very low.
The geomagnetic field at Learmonth (WA) was unsettled.
Ionospheric F2 critical frequencies at Sydney were near predicted
monthly values.

Comment:
Spoardic E was often observed this week. HF conditions may have
been degraded due to mild geomagnetic activity which has more or
less persisted since January the 11th. The source of this enhanced
geomagnetic activity is thought to be a broad south polar coronal
hole.

FORECAST FOR THE NEXT WEEK (21 - 27 JANUARY)

SOLAR: low, chance for isolated low level M class flare.

GEOMAGNETIC: mostly unsettled with active period expected
during January 22-23 and January 27-29. (Coronal holes).

IONOSPHERIC: propagation conditions are expected to be fair,
with degradations expected on January 22,23 and 27 to 29.

119. LARC VP2E DXpedition '94

Newsgroup: rec.radio.amateur.space
Date: 1994-01-21 16:10:09 UTC
From: jimkelly@astro.ocis.temple.edu
Message-ID: <1994Jan21.161009.23927@cronkite.ocis.temple.edu>
Source record: 28169

FOR RELEASE 1 JANUARY 1994

For more information contact: Jim Kelly, KK3K (215) 978-5272

LARC Announces DXpedition to VP2E

The Lambda Amateur Radio Club (LARC), an international club for gay, lesbian, bisexual, transgendered hams, shortwave listeners and computer enthusiasts and their friends and supporters, will sponsor it's third DXpedition in March 1994 with LARC members planning to operate on HF and OSCAR-13 Mode B and Mode S from the Caribbean island of Anguilla, British West Indies. The team of operators and equipment are planning to be on the air March 5-10, 1994.

Planned operations will include multi-band and multi-mode HF and OSCAR-13 Mode B and Mode S. This may be the first OSCAR-13 Mode S DXpedition for the record books.

The operators making the trip will be Jim Kelly (KK3K), Don Bledsoe (WB6LYI), Mark Wilcox (KC3XC), Tom Hendrix (KI4ZN), Howard Wyman (W9BVD), Norm Gray (KF7IK), James Keeth (AF9A), and Wayne Schuler (AI9Q). QSL for all operators is direct to current Callbook addresses only.

In March 1992, LARC sponsored OSCAR-13 Mode B DXpeditions to Anguilla, British West Indies (VP2E) and Tortola, British Virgin Islands (VP2V) and logged over 900 contacts.

In March 1993, a second team of five LARC operators put the island nation of Montserrat (VP2M) on OSCAR-13 Mode B and logged over 1150 contacts.

To make contacting the LARC VP2E DXpedition even more exciting, the club will automatically mail an engraved certificate to every station who successfully works either any HF operator and any OSCAR-13 operator OR any OSCAR-13 Mode B operator and any OSCAR-13 Mode S operator during the DXpedition.

The club has members in nine countries and local chapters around the United States. For membership information, write the Lambda Amateur Radio Club International Headquarters, P.O. Box 24810, Philadelphia, PA, USA, or call (215) 978-5272.

SpaceNews
=========

MONDAY JANUARY 24, 1994

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It is published every week and is made available for unlimited distribution.

* STS-60 AST
==========
Astronauts Charles F. Bolden, Jr. of Columbia, South Carolina and Ronald M. Sega of Seabrook, Texas, have been issued amateur radio call signs in preparation for their joint U.S.-Russia science mission. The Spacehab science objectives are primarily micro-gravity oriented with emphasis on materials and life science.

Bolden, KE4IQB is commander of the space shuttle Discovery (OV-103) due for lift off on February 3, 1994, at 12:10 UTC from Cape Kennedy. Sega (now KC5ETH) is the second of four Mission Specialists. They plan to contact several schools as part of the SAREX program - including one in Russia.

The flight of STS-60 represents an historic first, the first of several joint U.S.-Russian Space Shuttle flights planned in preparation for the development of the international Space Station. Veteran cosmonaut Sergei Krikalev, U5MIR, was chosen to be the first Russian to fly on the U.S. Space Shuttle. During the 8 day flight, Cosmonaut Krikalev will support the science operations on the Space Shuttle as Mission Specialist 4.

Last year, Sergei attended the Dallas Ham-Com convention and told us he would try to qualify for a U.S. license - but his training duties have prevented him from doing so. Since no reciprocal operating privileges exist between Russia and the United States, Sergei will operate amateur radio under Bolden's control operator authority. The possibility also exists for the first U.S. Space Shuttle to Mir Space Station (Russian astronaut-to-Russian cosmonaut) amateur radio contact!

Three new Russian amateurs were launched on January 8, 1994 aboard a Soyuz rocket and docked at the MIR space station on January 10th. The new crew includes Viktor Afanasiev (commander) U9MIR, Yuri Usachev (flight engineer) R3MIR and Valerij Polyakov (doctor) U3MIR. They are using the call sign

R0MIR on packet.

[Info via Fred, W5YI]

* FUJI-FAX *
============
With the Fuji-OSCAR-20 satellite schedule providing extended periods of analog (Mode JA) transponder operation, Ted (G6HMS) and Ian (G0NKA) in England have been exchanging FAX images through this satellite.

At first, the technique was a bit "iffy", but Ted and Ian gradually got the hang of following the doppler on the downlink to hold the picture. Unlike voice transmissions where the ear is relatively tolerant of frequency change, the same cannot be said for computers decoding FAX signals.

Ted and Ian initially started out exchanging black and white images with no grey scale. After correcting some transmission problems, images containing 256 grey levels were exchanged, and finally FULL COLOR FAX images were exchanged!

Ted and Ian used JV-FAX 6.0 software for making FAX transmissions, and a Shareware version of Microfax on receive. Both stations used an uplink on 145.980 MHz (LSB) which produced an FO-20 downlink on 435.820 MHz (USB).

If you have FAX capability, you are asked to join Ted and Ian as they exchange FAX images through the FO-20 satellite.

[Info via Ian, G0NKA @ GB7DTX.GBR.EU]

* SUPERBALL 1-94 UPDATE *
=========================
The attempt to recover the SuperBall 1-94 balloon and payload on Saturday 15-Jan-94 failed. Numerous troubles plagued the effort and they basically just ran out of day-light and had to turn back. Another attempt was made on the 16th) which was successful! All of the critical elements of the craft were recovered.

Preliminary reports indicate that another launch will take place in about a month's time.

[Info via Kris Nosack, N7SHV]

* STS-60 SAREX INFO *
====================
Mission: STS-60 Space Shuttle Discovery
Vehicle: OV-103/Discovery
Wake Shield Facility & Spacehab-2 Mission
Launch: February 3, 1994, 12:10 UTC from KSC Pad A
Landing site: KSC
Orbit: 57 degree inclination
Orbital altitude: 218 sm
Mission Length: 8 days (Nominal)
Crew size: 6

Amateur Radio Operators: Charlie Bolden (License Pending), Ron Sega
(License Pending), Sergei Krikalev, U5MIR

Modes: FM Voice
Prime callsign: To be provided once Commander Bolden's callsign is known

Packet Radio: Callsign W5RRR-1

Frequencies: All operations in split mode. Do not transmit on
the downlink frequency.

Voice Freqs: Downlink: 145.55 MHz (Worldwide)
Uplinks: 144.91, 144.93, 144.95, 144.97,
144.99 MHz (Except Europe)
144.70, 144.75, 144.80 MHz (Europe only)

Note: The crew will not favor any specific uplink frequency, so your ability
to work the crew will be the "luck of the draw."

Packet Freqs: Downlink: 145.55 MHz
Uplink: 144.49 MHz

[Info via KA3HDO]

* FO-20 OPERATION SCHEDULE *
============================
The FO-20 operation schedule is follows. Analog transponder and digital
transponder will be ON for a week respectively as they were since last
December.

Analog mode:
26-Jan-94 08:20 UTC -to- 02-Feb-94 06:50 UTC
09-Feb-94 07:15 UTC -to- 16-Feb-94 07:40 UTC
23-Feb-94 08:05 UTC -to- 02-Mar-94 06:40 UTC
09-Mar-94 07:05 UTC -to- 16-Mar-94 07:30 UTC
23-Mar-94 07:52 UTC -to- 30-Mar-94 08:15 UTC

Digital mode:
Unless otherwise noted above.

[Info via Kazu Sakamoto, JJ1WTK]

* CORRECTION *
==============
The next STS mission is STS-60, not STS-58 as indicated in last week's issue
of SpaceNews.

* THANKS! *

121. Two-Line Orbital Element Sets (TLE330)

Newsgroup: rec.radio.amateur.space
Date: 1994-01-21 23:06:28 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.759193588@afit.af.mil>
Source record: 28172
Cross-posted to: rec.radio.amateur.space,rec.radio.info

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.info.
This week's elements are provided below.

>> "Although there's a lot of good software being written at Johnson, the
>> computers on the shuttle are so obsolete that the manufacturers don't
>> make them anymore. The memories in them are the old kind, made with
>> little ferrite cores that have wires going through them. In the
>> meantime we've developed much better hardware: the memory chips of
>> today are much, much smaller; they have much greater capacity; and
>> they're much more reliable. They have internal error-correcting codes
>> that automatically keep the memory good. With today's computers we
>> can design separate program modules so that changing the payload
>> doesn't require so much program rewriting.
>>
>> Because of the huge investment in the flight simulators and all the
>> other hardware, to start all over again and replace the millions of
>> lines of code that they've already built would be very costly."
>>
>>(There's a lot of associated information that discusses how each mission
>>is flown on simulators using the same software before the actual mission.)
>>
>>So all of you core memory apologists can give it rest now. I think it's
>>pretty clear from the above excerpt that the core memory is a vestige of
>>the shuttle's past. It is not required for its alleged reliability or
>>immunity to extraterrestrial electromagnetic events.
>
>It's unsurprising that Shuttle computers aren't made anymore. They were
>special built for the Shuttle, and we aren't building any more Shuttles.
>However, the Shuttle computers have recently been upgraded, and three
>of the four now do use some ECC memory for non-critical data storage.

>ECC is *not* proof against SEUs, but it's much better than unprotected
>memory. ECC can protect against single bit errors, and most double bit
>errors, but a triple hit and it's game over. Core doesn't care.

There were plans at one point to use a 386-based system in the shuttle's
main computer systems, though the last time I heard anything about them
was before Challenger. (The garbage scow - earth controlled garbage
collector droid also has not been mentioned in years).

>
>>There's a lot of great information about the shuttle program in the
>>book. I believe someone mentioned in an earlier posting that the
>>shuttle doesn't need much memory and that's why core is acceptable.
>>Here's why that's not correct:
>>
>>From page 190:
>>
>> "The shuttle's computers don't have enough memory to hold all the
>> programs for the whole flight. After the shuttle gets into orbit, the
>> astronauts take out some tapes and load in the program for the next
>> phase of the flight -- there are a many as six in all. Near the end
>> of the flight, the astronauts load in the program for coming down.

From what I recall the tapes are kind of strange too. 9 track tape which
is read as 5 separate data streams when moving one way, 4 when moving
the other. Each track independent. Something about minimizing the amount of
movement needed to load a program, from what I recall...

>>
>> The shuttle has four computers on board, all running the same
>> programs. All four are normally in agreement. If one computer is out
>> of agreement, the flight can still continue. If only two computers
>> agree, the flight has to be curtailed and the shuttle brought back
>> immediately."
>>
>>If memory requirements really were minimal, it wouldn't be necessary to
>>be carrying all those tapes along.
>
>There's no good reason to have the entire software load for the entire
>flight profile in the computer at once. Loading in the proper programs
>at the proper time from tape is perfectly acceptable. Does your computer
>keep every bit of software you use in memory at all times? Of course not.
>That's why we have hard disks. However, hard disks aren't that sturdy
>when subjected to launch vibration and G forces, so Shuttle uses tape
>instead for program storage.

The latest hard disks are quite capable of handling the G forces present
in most any craft. The ratings on some of the new 3.5" and smaller drives
are something like 100Gs when off, and 20 or more Gs while running. Laptops
have had a wonderful influence on hard disk design.

>
>Note, Apollo used the HP-35 calculator as backup for it's computers,
>so the necessary data loads aren't that large. Shuttle carries the
>HP-41CV as an ultimate backup to it's computers. If all four main
>computers fail, the pilot can manually calculate trajectories with
>it's aid. Naturally it isn't as robust as the normal computers, but
>it's better than nothing, and takes up little mass or volume.

Are they still using the HP41s? I'd figured they'd have moved the programs
over to the grid laptops by now.

>
>Note also that program bloat can be traced almost completely to having
>excess RAM available. Programs naturally expand to fill the space available,
>witness Wordstar. It was a great fast program on a 48 kb Z-80 system, but

common misconception. Wordstar NEVER fit in 48K. Sure it would run in a
machine that had 48K, but every time you hit ^Y to delete a line, it
had to swap in an overlay from disk to do the function, then swap back
to the main code. When more memory is available, it is possible to
improve performance.

>now it's a multi-megabyte dog on a Windows PC with 8+ megs of RAM. And
>that's 166 times more RAM to develop a bit error that can crash the system.
>To a large degree, reliability is a function of parts count. The fewer
>parts, the less to go wrong.
>

Actually in software the less is better philosopy does not always hold. To
get program size smaller, one could always skip the bounds checking and input
parameter checking. Fewer parts, but less reliability...

>parameter checking. Fewer parts, but less reliability...

Bounds checking and and parameter checking make reliable software? I think that's a bit general in the case of shuttle computers and word processors. I got really happy when Display Write 4 used to lock up on an error whenever I hit the left margin with the cursor. "Attempt to backspace past left margin" it said helpfully.

Imagine the delight and relief of the shuttle pilot if the computer said something like "Subscript out of range. Program halted." when s/he was on final approach.

Make sure you understand the fine print. Many of these drives have their
published specifications based upon a SINGLE foo-G drop. This does not
equate to the sort of cruft a drive could expect to go through during a
single shuttle launch, let alone many.

For comparison, look at the building code specifications for the Los
Angeles ares. There are buildings and highway superstructures rated to
withstand a .4G accelleration during a 'quake. What isn't generally specified
is the *duration* of that .4G accelleration. .4G for 5 seconds can be *very*
differrent from .4G for 30 seconds. A shuttle launch is very comparable to
the recent Los Angeles 'quake if you're talking disk drives and buildings.

STS-60 AST

HR AMSAT NEWS SERVICE BULLETIN 022.01 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 22, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-022.01

STS-60 AST

Astronauts Charles F. Bolden, Jr. of Columbia, South Carolina and Ronald M. Sega of Seabrook, Texas, have been issued amateur radio call signs in preparation for their joint U.S.-Russia science mission. The Spacehab science objectives are primarily micro-gravity oriented with emphasis on materials and life science. Bolden (KE4IQB) is commander of the space shuttle Discovery (OV-103) due for lift off on February 3, 1994, at 12:10 UTC from Cape Kennedy. Sega (now KC5ETH) is the second of four Mission Specialists. They plan to contact several schools as part of the SAREX program - including one in Russia. The flight of STS-60 represents an historic first, the first of several joint U.S.-Russian Space Shuttle flights planned in preparation for the development of the international Space Station. Veteran cosmonaut Sergei Krikalev (U5MIR) was chosen to be the first Russian to fly on the U.S. Space Shuttle. During the 8 day flight, Cosmonaut Krikalev will support the science operations on the Space Shuttle as Mission Specialist 4. Last year, Sergei attended the Dallas Ham-Com convention and said he would try to qualify for a U.S. license - but his training duties have prevented him from doing so. Since no reciprocal operating privileges exist between Russia and the United States, Sergei will operate amateur radio under Bolden's control operator authority. The possibility also exists for the first U.S. Space Shuttle to Mir Space Station (Russian astronaut-to-Russian cosmonaut) amateur radio contact! Three new Russian amateurs were launched on January 8, 1994 aboard a Soyuz rocket and docked at the MIR space station on January 10th. The new crew includes Viktor Afanasiev (commander) U9MIR, Yuri Usachev (flight engineer) R3MIR and Valerij Polyakov (doctor) U3MIR. They are using the call sign R0MIR on packet.

STS-60 SAREX Mission Less Than Two Weeks Away

STS-60 is currently scheduled for launch on February 3, 1994 at 12:10 UTC. The flight of STS-60 represents an historic first -- the first joint U.S.-Russian Space Shuttle flight. This will be the first of several joint missions planned in preparation for the development of the international Space Station. Cosmonaut Sergei Krikalev, U5MIR, was chosen to be the first Russian to fly on the U.S. Space Shuttle. SAREX information for STS-60 including frequencies, callsigns and Keplerian elements, follows:

STS-60 Shuttle Amateur Radio Experiment (SAREX) Information Sheet

Mission: STS-60 Space Shuttle Discovery Wake Shield Facility & Spacehab-2 Mission

Launch: February 3, 1994, 12:10 UTC

Orbit: 57 degree inclination

Mission Length: 8 days (Nominal)

Amateur Radio
Operators: Charlie Bolden, KE4IQB, Ron Sega, KC5ETH,
Sergei Krikalev, U5MIR

Modes: FM Voice
Prime callsign: KE4IQB

Packet Radio
Callsign: W5RRR-1

Frequencies: All operations in split mode. Do not transmit on the downlink frequency.

Voice Freqs: Downlink: 145.55 MHz (Worldwide)
Uplinks: 144.91, 144.93, 144.95, 144.97, 144.99 MHz

(Except Europe)
144.70, 144.75, 144.80 MHz (Europe only)

Note: The crew will not favor any specific uplink frequency, so your ability to work the crew will be the "luck of the draw."

Packet Freqs: Downlink: 145.55 MHz
Uplink:144.49 MHz

Info: Goddard Amateur Radio Club, WA3NAN, Greenbelt Maryland, SAREX Bulletins and Shuttle Retransmissions

It's too bad that the programmer of Display Write 4 failed to add the code that DID SOMETHING when a boundary condition was hit. I maintain that I'd still rather have the checks there are DO SOMETHING about the case.

It is ENTIRELY possible for software to detect faults and respond to them. Rather than either hitting a boundary and giving up, or not bothering to check a boundary and corrupting data it makes sense to detect, report and correct for software faults where possible.

>
>Imagine the delight and relief of the shuttle pilot if the computer said
>something like "Subscript out of range. Program halted." when s/he was on
>final approach.

Imagine when the computer fails to detect a bounds condition, corrupts memory and fails to continue processing joystick commands to the flaps. If the computer detects its bounds problem, it can at least take itself out of the loop and nominate a backup system when backup systems are available (as is the case on the shuttle). These principles apply to real time, mission critical, fault tolerant and Online Transaction Processing systems. In all cases the customer has paid for a system to solve a problem under all

conditions. Stopping and giving a panic message, or failing to detect a fault are equally unacceptable solutions.

133. Low Pass filter vs Band Pass - Mode JD

Newsgroup: rec.radio.amateur.space
Date: 1994-01-24 11:53:17 UTC
From: seeler@UPEI.CA
Message-ID: <seeler.73.759412397@UPEI.CA>
Source record: 28185

I have some desensing of my 440 rig on receive when the 2 meter rig fires up on Mode JD. This is not a MAJOR problem but I would like to resolve it. I suspect that it involves the 3rd harmonic of the 2 meter Transmitter.

The books suggest using a low pass or band pass filter - but they differ as to which would be best (opinion or operation differences?). I use the all IC275 for Dx and local operations as well and suspect that the low pass filter would be a good start. The filter in the VHF/UHF Dx book appears to fit my needs - 35? db attenuation of the 2nd harmonic and 60 db attenuation of the 3rd - with minimal (?) insertion loss.

My questio is this - is the low pass filter the best way to solve this particular issue - and if so - does anyone have any suggestions as to any particular filter design / schematics - and comments as to how they/it works?

Thanks for considering this post.

Actually there are two other driving forces in the software bloat that are only allowed to operate because of the cheap RAM: 1) The demand for software that requires no thought or training. Some of this is good and some of it is useless "creeping featurism" (I have yet to understand why a top quality word processing package would require you to remove your hands from the keyboard to perform basic formatting functions). And 2) the trend toward using high-level languages for all software development. Most of those "lean and mean" packages of the past were written in optimized assembly code because RAM was tight. Now they don't have to put any effort into optimizing the code and are able to write using high-level languages and compilers that generate absolutely

horrendous code (from an efficiency standpoint). Yes, that allows them to meet the demands of (1) above more quickly but at a tremondous cost in storage space (just for grins look at the bloat in the distribution disks for ANY package over the last few years - things that used to be delivered on 2 360K floppies now require 4 to 6 1.44M floppies and add data compression to boot). Whether this whole trend is good or bad is a totally religious argument (hardware is cheap and features are nice versus why do I need so much hardware just to run a simple application).

However, any way you look at it my hat goes off to the programmers who are able to fit the entire control program for the Shuttle into the memory on those computers. I can guarantee they are not using the bloated high-level languages that you normally see in the PC world to do that.

135. question about a calculation of satellite orbit

Newsgroup: rec.radio.amateur.space
Date: 1994-01-24 23:19:49 UTC
From: benjie@hip-hop.sbay.org
Message-ID: <2i1l2l$6eo@hip-hop.hh.sbay.org>
Source record: 28196
Cross-posted to: sci.space,rec.radio.amateur.space

The question is at end. Here is the description of the problem I am having.

I was trying to calculate the longitude for oscar 21. I got the following formulas from a friend of mine.

Lon[W] = {[(JxR-D)x24+6.6285792]*15}-RAx

Where J is the julian day (in days) with out year, that is, something like 24.8777day. R is the earth rotation rate 1.002737851 rev/day. D is the integral value of JxR. (JxR-D)x24+6.6285792 is the Greenwich Sidereal Time (GST) in hours, thus [(JxR-D)x24+6.6285792]*15 is GST in degrees. RAx is the RA at current time.

RAx = RA0 + [Jx-J0]x(d(RA)/dt)

RA0 and J0 are the RA and Julian day at epoch. d(RA)/dt is the rate of change of RA.

Here are my calculations:

At PST time 12:00, or UTC time 20:00 today (UTC date Jan 24),
the Julian day (UTC) is

25.83333

therefore I calculated (JxR-D)*24+6.6285792, GST in hours, to be

28.32605

subtracting since it is greater than 24, I subtracted 24 from it,
and got

4.32605

multiply by 15 I got

64.89070

which is the GST in degrees.

Then I calculated the RAx. I used the data (got from the net) with epoch 94019.17209926. RA at that point is 252.9794.

In order to calculate d(RA)/dt, I had to find the data with epoch 94012.62069919. RA at that point is 257.8282.

Thus the d(RA)/dt is approximately

(252.9794-257.8282)/(19.17209926-12.62069919) = -0.74012

Therefore the RAx at 25.83333 would be

252.9794 + (25.83333-19.17209926)x(-0.74012) = 248.049312108.

Now the lon[w] should be the difference between GST in degrees and RAx.

GST in degrees - RAx = 64.89070 - 248.049312108 = -183.15861 degree W.

So here is the problem, my tracking software, PCTRACK, predicted a lon of 145.1 east.

I don't see a correlation between the two numbers. Did I use the wrong formula? Are the formulas the same for all sat? Is Oscar 21 somewhat different?

All information, answers are welcome.

Thanks

Benjie

As far as I know (from a job application with the European Space Agency),
all the code for the Ariane system is written in Modula-2 (which, by any
definition, is a high-level language).

Modern optimizing compilers can do a _very_ good job. In many instances,
it'd take a top-flight programmer to do better at the assembler level
(as well as an awful lot more time).

ASA MEMBERSHIP INFORMATION

The Electronic Journal of the Astronomical Society of the Atlantic (EJASA) is published monthly by the Astronomical Society of the Atlantic, Incorporated. The ASA is a non-profit organization dedicated to the advancement of amateur and professional astronomy and space exploration, as well as the social and educational needs of its members.

ASA membership application is open to all with an interest in astronomy and space exploration. Members receive the Journal of the ASA (the JASA is a hardcopy sent through United States Mail and is not a duplicate of this Electronic Journal) and the Astronomical League's REFLECTOR magazine. Members may also purchase discount subscriptions to ASTRONOMY and SKY & TELESCOPE magazines.

For information on membership, you may contact the Society at any of the following addresses:

Astronomical Society of the Atlantic (ASA)
P. O. Box 15038
Atlanta, Georgia 30333-9998
U.S.A.

asa@chara.gsu.edu (For ASA issues)
klaes@verga.enet.dec.com (For EJASA issues)

ASA BBS: (404) 321-5904, 300/1200/2400 Baud

or telephone the Society Recording at (404) 264-0451 to leave your address and/or receive the latest Society news.

ASA Officers and Council -

President - Eric Greene
Vice President - Jeff Elledge
Secretary - Tex Ratcliff
Treasurer - Cindy Weaver
Directors - Don Barry, Harry Gelblat
Council - Bill Bagnuolo, Frank Guyton, Larry Klaes, Ingrid Siegert-Tanghe, John Stauter, Wes Stucky, Harry Taylor, Gary Thompson, Bob Vickers

ARTICLE SUBMISSIONS

Article submissions to the EJASA on astronomy and space exploration are most welcome. Please send your on-line articles in ASCII format to Larry Klaes, EJASA Editor, at the following net addresses or the above Society addresses:

klaes@verga.enet.dec.com
or - ...!decwrl!verga.enet.dec.com!klaes
or - klaes%verga.dec@decwrl.enet.dec.com
or - klaes%verga.enet.dec.com@uunet.uu.net

You may also use the above addresses for EJASA back issue requests, letters to the editor, and ASA membership information.

When sending your article submissions, please be certain to include either a network or regular mail address where you can be reached, a telephone number, and a brief biographical sketch.

Back issues of the EJASA are also available from the ASA anonymous FTP site at chara.gsu.edu (131.96.5.29). Directory: /ejasa

Ultraviolet Rays

Our planet Earth's atmosphere is opaque to radiation in the ultraviolet waveband due to ozone and molecular absorption. As a result, astronomy in these wavelengths has to be carried out from above the atmosphere, preferably with artificial satellites.

The band divides rather naturally into two regions. The region 300 > lambda > 120 nanometers can be studied using techniques similar to those used in optical astronomy. At shorter wavelengths, however, it is difficult to find materials which reflect radiation at normal incidence. Rather, the incident radiation is simply absorbed by the mirror material with little or no reflection.

Perhaps the main problem for using this waveband as a detector for extraterrestrial intelligence is that at wavelengths shorter than 91.2 nm, the Lyman limit for hydrogen, interstellar gas becomes opaque, probably due to photoelectric absorption by neutral hydrogen in the Lyman continuum. This effect is particularly important for objects localized inside our Milky Way galaxy.

In spite of all these limitations, in 1974, H. Wischnia used the facilities of the Orbiting Astronomical Satellite (OAO, also called COPERNICUS) to search for ultraviolet laser pulses around the nearby stars Epsilon Eridani, Tau Ceti, and Epsilon Indi (Tarter, 1991). The observations were carried out in ultraviolet wavelengths below 0.28 micrometers.

Of particular interest in this waveband are the Lyman series of absorption lines with wavelengths of 1214 A, 1024 A, 971 A, 948 A, and 937 A (where A is Angstrom), corresponding to the various fully excited states of the hydrogen atom. The predominant line is the so-called "Lyman Alpha" of 1024 A. It is quite possible that an extraterrestrial civilization could choose to generate a signal which

may lie close to, or preferably right within, the absorption region. The background radiation of our Sun (and presumably other solar-type stars) is down by a factor of 10exp6 at Lyman Alpha wavelengths when compared with the output of visible light. Such a reduction offers a considerable improvement in the signal-to-noise ratio.

X-Rays

Elliot (1973) pointed out that X-rays are not appropriate as a means of transmitting a continuous stream of information because of their high quantum noise. As a means of sending and receiving the "first beacon signal", however, he considered that X-rays could have certain advantages. Elliot analyzed the X-ray emissions of the terrestrial nuclear explosions carried out in the early 1960s. When a nuclear weapon explodes, about seventy percent of the energy released is in the form of kilovolt X-rays. This X-ray pulse is formed in less than one microsecond. If the explosion occurs above eighty kilometers, the X-rays are not absorbed by the atmosphere and are free to propagate into space.

Other advantages of using the X-ray pulse generated by a high-altitude nuclear explosion are: (a) The pulse is short and will not be broadened or appreciably attenuated by propagation through the interstellar medium; (b) there are not stringent requirements on the receiver, since the pulse covers a broad X-ray spectrum; and (c) the X-ray flux involved is much larger than that of a solar-type star, a natural source of X-rays.

Elliot estimated the distance at which the United States "Starfish" nuclear test could be detected by our present technology of X-ray detectors. Assuming that the energy of the explosion is equivalent to 1.4 megatons and that the X-ray pulse was equally intense in all directions, he found that this explosion should be detected from a distance of d~400 Astronomical Units, about ten times the radius of Pluto's solar orbit.

Supposing that all the terrestrial nuclear powers [3] pooled their nuclear weapons stockpiles to produce a single explosion in space (E~2x10exp4 megatons). Considering that the X-ray pulse could be concentrated into a conical beam of about thirty degrees in angle with no loss of radiation, a typical terrestrial X-ray detector should be able to detect a signal from a distance of ~190 light years.

==========
3 - In 1989 the United States and the Soviet Union had almost 55,000 nuclear warheads with a combined destructive power of 15,500 megatons (Source: Bulletin of Atomic Scientist, 1990).
==========

Fabian (1977) suggested that a supercivilization (in the transition from Kardashev's Type I to Type II) could - in the same sense of the proposals by Drake and Shklovskii - drop material onto

a neutron star. This material could be impinged onto the surface at about one-third of the velocity of light. About ten percent of the rest mass energy of the matter will emerge as radiation, predominantly as X-rays if the mass flow rate exceeds ~10exp16 F gm sec-1, F being the fraction of the surface onto which matter falls.

Thus, to produce an X-ray flash as energetic as that suggested by Elliot (1973), ten tons of matter of any composition would have to be dropped onto a neutron star. According to Fabian (1977), such a flash will be broadband and almost omnidirectional, although some beaming may occur if the neutron star possesses a strong magnetic field.

The above arguments show that an object of about one kilometer in size and 10exp16 gm dropped onto a neutron star could produce an X-ray pulse (E~10exp36 ergs) strong enough to be easily detectable throughout the Milky Way galaxy. Harwit and Salpeter (1973) argue that the soft gamma-ray burst observed by Klebesadel et al (1973) may be due to comets falling onto the surface of a neutron star. If an advanced civilization could cause individual objects that might be easily found in the neutron star's neighborhood to fall onto the star in a pre-arranged pattern, this could be detected across the galaxy.

Gamma Rays

Viewing et al (1977) pointed out that an alternative method for SETI could be the detection of alien artifacts. Because most of the different models for interstellar propulsion (Mallove and Matloff, 1989) produce copious quantities of gamma rays, they proposed the search for this kind of radiation from the antimatter annihilation process. Harris (1986) showed that interstellar spacecraft as gamma-ray sources will be most easily recognized by their proper motions. Their velocities, being substantial fractions of the velocity of light, will be at least one hundred times as large as the highest velocities characteristic of normal astronomical objects. No steady gamma-ray source is known with a proper motion as large as one degree per year.

For spacecraft of sufficient size, the poor angular resolution of current gamma-ray telescopes imposes a limit on identification rather than detection. Of the Compton Gamma-Ray Observatory (GRO) instruments, EGRET has an angular resolution of 1.6 degrees at 100 MeV. The best possible resolution of BATSE is 0.5 degrees (Kurfess, 1985, Morris, 1985). In the most favorable circumstances - purely tangential velocity close to c; observations made over the ten-year lifetime of GRO - these resolutions will be able to detect the motion of spacecraft at distances of ~100 parsecs and ~300 parsecs, respectively. The distinctive line emission from these objects is readily detectable if the spacecraft is sufficiently massive. A consumption of ~(1 to 10)Rexp2 tons per second of antimatter is necessary for detection by GRO of a spacecraft at a distance R in pc (Harris, 1991b).

Harris (1991a) reported the negative results of a search for the linear alignments of burst along a potential spacecraft trajectory, using burst locations and spectra observed by the 1978-1980 inter-planetary network of gamma-ray detectors.

Improvements in the measurement of gamma-ray source positions may be expected from two directions. For steady sources and very bright transients, larger detectors will achieve improved signal-to-noise ratios and hence better source positions for a given angular resolution. However, the positions of most of the gamma-ray bursts are measured more accurately from the event delay times across interplanetary distances (Harris, 1991b). Progress in this field is dependent on future space mission launch schedules.

Particle Astronomy

Atomic Microscopic Particles

Another technique of astronomical investigation relies on the observation of microscopic particles which stream toward Earth in huge numbers from different directions. They include elementary particles such as electrons, protons, and heavier and complex atomic particles. The more energetic of these particles are frequently referred to as cosmic rays. Another amazing particle that could be use as an "information carrier" is the neutrino.

Neutrinos

A neutrino is a weakly interacting particle that travels at essentially the speed of the light and has an intrinsic angular momentum of 1/2 (h/4 PI). Neutrinos are produced on Earth by natural radioactivity, nuclear reactors, and high-energy accelerators. There are six types of neutrinos and three flavors of neutrinos and anti-neutrinos. Each are associated with a massive lepton that experiences weak, electromagnetic, and gravitational forces, but not strong interactions. The known leptons are electrons, muons, and taus (in increasing order of their rest masses).

Because neutrinos interact only weakly with matter, they can reach us from otherwise inaccessible regions where photons are trapped. Hence, with neutrinos, we can look inside stars and examine directly energetic physical processes that occur only in stellar interiors. Large detectors, consisting typically of hundreds or thousands of tons of material, are required to observe "astronomical neutrinos".

The neutrino burst detected from Supernova 1987A confirmed the basic theory of core collapse and refined our views of neutrino properties. Twenty neutrinos in the energy range from 6 to 39 MeV were detected over ~12 seconds (Chevalier, 1992). Given the distance to the Large Magellanic Cloud galaxy and the sensitivity of the instruments, the results were consistent with an emission of about 10exp58 neutrinos in the supernova. To have a real idea about the difficulties in the detection of this particle, it was estimated that during those ~12 seconds, more than 10exp11 neutrinos passed through

each square centimeter of Earth. Our technology was only capable of detecting twenty of them.

There have been several proposals to use collimated neutrino beams in the energy range from 1 to 100 GeV as a potential means for telecommunication over global distances of 10exp3 - 10exp4 kilometers (Saenz et al 1977, Uberall et al 1979). Similar proposals for telecommunication for not only global but also interstellar and intergalactic distances were investigated by Subotowicz (1979) and Pasachoff and Kutner (1979).

The main difficulty of all these ideas is the low cross-section of interaction of the neutrino and their very low detection efficiency. Subotowicz (1979) suggested that some advanced civilizations may deliberately shut out emergent civilizations such as ours from the conversation. Generation and detection of neutrinos is so difficult that an advanced civilization may purposely choose such a system in order to find and communicate only with their own level of development.

Electrons, Protons, and Heavy Particles (Cosmic Rays)

Highly energetic protons, neutrons, electrons, positrons, and a wide variety of heavier nucleons constitute the cloud of galactic cosmic ray particles. Anti-nucleons consisting of antimatter have been sought: During the 1980s, anti-protons were found. Unstable sub-nuclear particles are not expected to figure significantly as carriers of cosmic information. Their short lifetimes preclude travel over long distances in the Universe, unless the most extreme energies are assumed.

The energy range of galactic, or possible extragalactic, cosmic ray particles that we can hope to use as carriers of information lies between 10exp11 eV and 10exp21 eV. However, most of the stable cosmic rays are charged, therefore studies at high angular resolution, high spectral (energy) resolution, or high time resolution are not likely to yield a great deal of "information". Galactic magnetic fields scramble all "memory" of where and how the particles originated and make uncertain the time of origin, including the initial energy of the particle.

This kind of information carrier presents several disadvantages for interstellar communication. Due to the electric charge of electrons and protons and their interaction with the magnetic interstellar fields (~ 5x10exp(-6) Gauss), a Lorentz force will act on both particles, but with opposite direction. The relevant relativistic equations are V/c = ((1-(Mexp2 x cexp4))/Eexp2)exp(1/2) and R=MV/QB(1-Vexp2/cexp2)exp(1/2)sen(alpha), where c is the speed of light, V is the particle velocity, M is the particle mass, Q is charge, B is the magnetic flux density, E is the particle energy, R is the curvature radius, and alpha is the angle between the galactic field and the direction of the particle beam.

Assuming the beam is aimed properly, it will curve around and just barely reach the target if R is one-half the distance thereto (Freitas, 1977). If we send a message via high energy protons across ten light years, E must be at least 1.4x10exp16 eV if alpha equals ninety degrees. Of course this assumes a nice uniform B field all the way, a dubious proposition at best. In view of the galactic deflection problem, it is difficult to see how charged particle beams could represent a communication mode for advanced extraterrestrial civilizations.

Macroscopic Objects

The planet Earth is incessantly bombarded by matter whose information content is far from negligible. For example, the stream of extraterrestrial matter gives direct information about the abundance of the elements in the sites where the matter was produced, which mainly involves the history of the solar system. Meteorites are one such group of objects which can be handled and subjected to laboratory tests and analyzes. Meteoric dust brought to Earth by rain or snow can be studied in the same way. The difference here is that these particles or objects can be examined and re-examined in a leisurely way. They are not so transient as individual photons or fermions.

There have been some speculations that a simple biological system carrying a message and capable of self-replication in suitable environments may be one possible channel for interstellar communication (Yokoo and Oshima, 1979, and Nakamura, 1986). These kinds of ideas have several and severe objections. For example, the impossibility to predict the environment of the target star in order to favor the self-replication of the molecular structure, the impossibility to avoid the destruction of the content of the message by the molecular mutations, and the impossibility for us to distinguish between a "natural" organism and a real biological interstellar message.

Direct Techniques

With the development of the Space Age, the way has been opened for a more direct approach to many phases of extraterrestrial exploration. Such probes can transport sensing devices for direct measurements at distant locations and telemeter their findings back to Earth. The human race's capacity for observation and interpretation of diverse and unexpected phenomena make manned exploration the ultimate goal.

In the past thirty years, there have been several proposals of rapid space probes (v > 0.1 c) for interstellar travel purposes, including pulsed fusion and antimatter-powered rockets, laser-pushed light sails, and interstellar ramjets (Mallove and Matloff, 1989). The scale of the undertaking, from both a technological and economic perspective, is such that they are unlikely to be realized for at least one century (Crawford, 1990).

The most ignored factor in discussing interstellar flight is the kinetic energy that must be invested in the ship to make its tons of matter move at a substantial fraction of the speed of light (Oliver, 1981; Purcell, 1959; von Hoerner, 1962). This turns out to be the dominant energy requirement and is thus a useful lower bound on the total. If, in assessing the cost of interstellar travel, we find this lower bound too big, all the other costs can be negligible.

Bracewell (1960, 1975) and Freitas (1980a) have discussed the possible superiority of interstellar probes in missions of galactic exploration. Freitas (1980b) and Valdes and Freitas (1980) have raised the issue of self-organized machines in related context. The non-detectability of the proposed probes has been used as an argument to establish that we are the only technological civilization in the entire Milky Way galaxy (Tipler, 1980).

Under the assumption that an extraterrestrial probe will be interested in life in our solar system, a near-Earth search was carried out for these kinds of artificial objects by Freitas and Valdes (1980, 1983, 1985). Other proposals to search for extraterrestrial artifacts in our neighborhood were proposed by Papagiannis (1978, 1985).

Errata -

The following are corrections of errors made in Part 1 of this article in the December 1993 issue of the EJASA. I regret the errors and apologize for them. I thank Guillermo A. Lemarchand for finding and correcting the information. - The Editor

The text reads:

TYPE II: A civilization capable of utilizing and channeling the entire radiation output of its star. The energy utilization would then be comparable to the luminosity of our Sun, about 4x1026 Watts.

It should read 4x10exp26 Watts.

The text reads:

structures in the range 3 Kelvin s T s 300 K, the consumption of energy in the range 1 Luminosity (Sun) s L s 10exp12 L(Sun), structures with sizes up to 100 kiloparsecs (kpc), and distances up to Dw 1000 megaparsecs (mpc). One parsec equals 3.26 light years.

It should read "3 Kelvin s Ts 300 K" (the symbol is minor or equal combination of < and =). The next line should read "1 Luminosity (Sun) s Ls 10exp12 L (Sun)". Where it says Dw 1000 megaparsecs (mpc) it should read "~ 1000 megaparsecs (Mpc)", using the symbol of "almost equal" and "Mpc", not milliparsecs (mpc).

The text reads:

now, only a small fraction of the whole Haystack has been explored (w 10exp(-15) - 10exp(-16)).

Instead of w it should read ~.

The text reads:

modest "Type 0" (w10exp13 W/Hz, Rw0.4 A.U., Dw5000 m, and lambdaw1 m) to the transition from "Type I" to "Type II" (w2x10exp24 W/Hz, Rw0.4 A.U., Dw10 m, lambdaw1 mm).

Replace w per ~, and Rw per r, Dw per ~, and so on.

The text reads:

In 1993, MANIA was used from the 2.15-meter telescope of the Complejo Astronomico El Leoncito in Argentina, to examine fifty nearby solar-type stars for the presence of laser pulses (Lemarchand et al, 1993).

This MANIA project did *not* take place in 1993.

The text reads:

resonance line. If we consider that the typical spectral line width might be about 1, and if we assume that a ten percent absorption

After 1 it should read 1 armstrong.

New Oscar on soon

Amateur satellite Korean Oscar 25 (KO-25) is expected to be available for use beginning about February 1. The satellite, launched last fall and originally designated KITSAT-B, has been under test since then.

KO-25 is a 9600 bit/s packet store-and-forward satellite similar to KO-23, with uplinks on 2 meters and downlinks on 70 cm.

KO-25's builder, the Korean Advanced Institute of Science and Technology (KAIST), thanks potential users of the satellite for their cooperation up to now in not attempting to use the KO-25 BBS.

The Institute said that testing is expected to continue after February 1, and there may be interruptions of service, but they are not expected to cause any ''serious problems.''

''We hope you enjoy our new star in space,'' said Hyungshin Kim of KAIST.

More information on KO-25 was in October 1993 QST, page 98.

IPS RADIO AND SPACE SERVICES AUSTRALIA
Daily Solar And Geophysical Report
Issued at 2330 UT 25 January 1994
Summary for 25 January and Forecast up to 28 January
IPS Warning 02 was issued on 25 January and is
current for the interval Jan 27-29.

1A. SOLAR SUMMARY
Activity: moderate

Flares Max Fadeout Begin End Freq. Sectors
M1/1N 1836UT none

Observed 10.7 cm flux/Equivalent Sunspot Number : 132/086

1B. SOLAR FORECAST
26 January 27 January 28 January
Activity Low Low Low to moderate
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number : 130/084

1C. SOLAR COMMENT
One solar region has shown rapid growth overnight.

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth : quiet

Estimated Indices : A K Observed A Index 24 January
Learmonth 04 2211 1012
Fredericksburg 05 03
Planetary 05 03

2B. MAGNETIC FORECAST
DATE Ap CONDITIONS
26 Jan 10 Quiet.
27 Jan 20 Unsettled to active.
28 Jan 20 Unsettled to active.

2C. MAGNETIC COMMENT
None.

3A. GLOBAL HF PROPAGATION SUMMARY
LATITUDE BAND
DATE LOW MIDDLE HIGH

25 Jan normal normal normal
PCA Event : None.
3B. GLOBAL HF PROPAGATION FORECAST
LATITUDE BAND
DATE LOW MIDDLE HIGH
26 Jan normal normal fair

IPS RADIO AND SPACE SERVICES AUSTRALIA
Daily Solar And Geophysical Report
Issued at 2330 UT 26 January 1994
Summary for 26 January and Forecast up to 29 January
IPS Warning 02 was issued on 24 Jan and is still current.

1A. SOLAR SUMMARY
Activity: Moderate

Flares: M1/0F at 0136UT

Observed 10.7 cm flux/Equivalent Sunspot Number : 128/81

1B. SOLAR FORECAST
27 January 28 January 29 January
Activity Low to moderate Low to moderate Low
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number : 130/84

1C. SOLAR COMMENT
None.

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth : Mostly unsettled with active periods
from 06-09UT and 12-15UT.

Estimated Indices : A K Observed A Index 25 January
Learmonth 17 3343 4233
Fredericksburg 17 05
Planetary 15 04

2B. MAGNETIC FORECAST
DATE Ap CONDITIONS
27 Jan 20 Unsettled to active.
28 Jan 18 Unsettled to active.
29 Jan 12 Unsettled.

2C. MAGNETIC COMMENT
None.

3A. GLOBAL HF PROPAGATION SUMMARY
LATITUDE BAND
DATE LOW MIDDLE HIGH
26 Jan normal normal normal

PCA Event : None.
3B. GLOBAL HF PROPAGATION FORECAST
LATITUDE BAND
DATE LOW MIDDLE HIGH
27 Jan normal normal fair-normal
28 Jan normal normal fair-normal
29 Jan normal normal fair-normal
3C. GLOBAL HF PROPAGATION COMMENT
NONE.

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
MUFs at Sydney were near predicted with 15-40% enhancements from
09-14UT and at 18UT.

T index: 56

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
DATE T-index MUFs
27 Jan 50 Near predicted to 20% enhanced.
28 Jan 45 Near predicted to 20% enhanced.
29 Jan 45 Near predicted to 20% enhanced.

Predicted Monthly T Index for January is 30.

4C. AUSTRALIAN REGION COMMENT
None.

Daily Solar And Geophysical Report
Issued at 2330 UT 27 January 1994
Summary for 27 January and Forecast up to 30 January
IPS Warning 02 was issued on 24 Jan and is still current.

1A. SOLAR SUMMARY
Activity: moderate

Flares Max Fadeout Begin End Freq. Sectors
M2/SN 0510UT confirmed 0508UT 0540UT lower E. Asia/Aust.

Observed 10.7 cm flux/Equivalent Sunspot Number : 120/072

1B. SOLAR FORECAST
28 January 29 January 30 January
Activity Low to moderate Low to moderate Low to moderate
Fadeouts Possible Possible Possible

Forecast 10.7 cm flux/Equivalent Sunspot Number : 120/072

1C. SOLAR COMMENT
None.

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth : unsettled with active levels from
15-18UT

Estimated Indices : A K Observed A Index 26 January
Learmonth 13 3233 3332
Fredericksburg 15 17
Planetary 22 17

2B. MAGNETIC FORECAST
DATE Ap CONDITIONS
28 Jan 18 Mostly unsettled with an isolated active period.
29 Jan 12 Quiet to unsettled.
30 Jan 08 Quiet to unsettled.

2C. MAGNETIC COMMENT
None.

3A. GLOBAL HF PROPAGATION SUMMARY
LATITUDE BAND
DATE LOW MIDDLE HIGH

27 Jan fair-normal fair-normal fair-normal
PCA Event : None.
3B. GLOBAL HF PROPAGATION FORECAST
LATITUDE BAND
DATE LOW MIDDLE HIGH
28 Jan fair-normal fair-normal fair-normal
29 Jan normal fair-normal fair-normal
30 Jan normal fair-normal normal
3C. GLOBAL HF PROPAGATION COMMENT
Chance of fadeout on daylight circuits.

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
MUFs at Sydney were mostly 15-30% above monthly predicted values, and
30-50% above from 08-10UT and 13-14UT. Sporadic E may have affected F
layer communications during daylight hours. A fadeout in response to
the M2 flare occurred from 0508-0540UT.

T index: 81

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
DATE T-index MUFs
28 Jan 45 Near predicted to 20% enhanced.
29 Jan 45 Near predicted to 20% enhanced.
30 Jan 45 Near predicted to 20% enhanced.

Predicted Monthly T Index for January is 30.

4C. AUSTRALIAN REGION COMMENT
Sporadic E may affect F layer communications, particularly during
daylight hours. Chance of fadeout on daylight circuits.

T 38 53 75 73 82 56 81

SUMMARY OF ACTIVITY

January 21
Solar activity was very low.
The geomagnetic field at Learmonth (WA) was quiet to unsettled.
Ionospheric F2 critical frequencies at Sydney were near predicted
monthly values.

January 22
Solar activity was low.
The geomagnetic field at Learmonth (WA) was quiet to unsettled.
Ionospheric F2 critical frequencies at Sydney were slightly above
predicted monthly values.

January 23
Solar activity was low.
The geomagnetic field at Learmonth (WA) was quiet to unsettled.
Ionospheric F2 critical frequencies at Sydney were about 15% above
predicted monthly values.

January 24
Solar activity was low.
The geomagnetic field at Learmonth (WA) was quiet.
Ionospheric F2 critical frequencies at Sydney were about 15% above
predicted monthly values.

.SK
January 25
Solar activity was moderate, with an M1/1N flare at 1836UT.
The geomagnetic field at Learmonth (WA) was quiet.
Ionospheric F2 critical frequencies at Sydney were 15-30% enhanced
00-14 UT, then near predicted monthly values.

January 26
Solar activity was moderate, with an M1/0F flare at 0136UT.

The geomagnetic field at Learmonth (WA) was mostly unsettled with
active periods from 06-09UT and 12-15UT.
Ionospheric F2 critical frequencies at Sydney were near predicted
with 15-40% enhancements from 09-14UT and at 18UT.

January 27
Solar activity was moderate, with an M2/0N flare at 0510UT.
The geomagnetic field at Learmonth (WA) was unsettled with active
levels from 15-18UT.
Ionospheric F2 critical frequencies at Sydney were mostly 15-30%
above monthly predicted values, 30-50% above from 08-10UT and
13-14UT. Sporadic E may have affected F layer communications during
daylight hours. A fadeout in response to the M2 flare occurred from
0508-0540UT.

FORECAST FOR THE NEXT WEEK (28 - 3 FEBRUARY)

SOLAR: Low to moderate

GEOMAGNETIC: Quiet to unsettled

IONOSPHERIC: Near predicted to 20% above monthly predicted values.
Possibility of fadeouts on daylight circuits.

* TUBSAT-B AND METEOR-3 LAUNCHED *
==========
TUBSAT-B is the second scientific Microsatellite build by the Technical University of Berlin (TUB), Germany.

It was launched 25-Jan-94 from Plesetsk, Russia at 00:25 UTC together with the new Russian meteorological satellite METEOR-3. TUBSAT-B successfully separated from METEOR-3 at 09:42:50 UTC.

TUBSAT-B Downlink is on 143.075 MHz with FFSK Modulation. The beacon is transmitting a 2 second burst every 2 minutes. The satellite has not yet been heard by it's command station. Although it is not a ham radio satellite, any report is most welcome. Reports can be sent via packet radio to DL4OAD @ DK0MAV.DEU.EU

METEOR-3 Keplerian elements:

Reference Epoch 94 025.23119078
Inclination 82.5637 deg
RAAN 157.1120 deg
Eccentricity 0.0014635
Argument of Perigee 262.7207 deg
Mean Anomaly 97.2234 deg
Mean Motion 13.16729004 rev/day
Decay Rate 5.0e-8 rev/day/day
Revolution Number At Epoch 3

152. Anik Satellite Troubles

Newsgroup: rec.radio.amateur.space
Date: 1994-01-29 16:47:06 UTC
From: dv736@cleveland.Freenet.Edu
Message-ID: <2ie3ua$i1n@usenet.INS.CWRU.Edu>
Source record: 28210

Does anyone have the latest information on what is happening to
the Canadian Satellite Anik E1 and E2. The Wall Street Journal
Reported that these 2 satellites were damaged by a electrostatic
disturbance which upset the ability of the bird to stay pointed
at the earth. Most of the Canadian programming was on what I
called A1 and there is no signal from that guy right now. The
other Anik satellite which only had a few video transponders is
now loaded with some of the video formerly on A1. Thanks.

153. Two-Line Orbital Element Set Format

Newsgroup: rec.radio.amateur.space
Date: 1994-01-29 16:50:00 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.759815870@afit.af.mil>
Source record: 28204
Cross-posted to: rec.radio.amateur.space,rec.radio.info

As a service to the satellite user community, the following description of the NORAD two-line orbital element set format is uploaded to sci.space.news and rec.radio.info on a monthly basis. The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity. In addition, element sets (also updated daily) and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 0 is a eleven-character name.

Lines 1 and 2 are the standard Two-Line Orbital Element Set Format identical to that used by NORAD and NASA. The format description is:

```
Line 1
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BST
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods, plus signs = 0; minus signs = 1)
```

Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6
1 11416U 86 50.28438588 0.00000140 67960-4 0 5293

Some time ago, a fix for InstantTrack appeared on BBSs to fix the problem of the new checksums in 2-line elsets. I got the fix from a BBS and applied it and it worked fine. However, I recently reloaded my InstantTrack and realized I cannot find the "fix" program. Anyone know of an Internet or BBS location where I could get it. Thanks.

Phil, I put lots of satellite progs, including the patch you need, on
PC.USL.EDU in the pub/ham/sat directory.

TO ALL RADIO AMATEURS BT
BID: $ANS-028.01

DOVE (DO-17) Telemetry Watchers Will Be Recognized

This weekend the DOVE (DO-17) Command Team will begin using the DOVE text message frame to transmit the callsigns of everyone who has sent a DOVE reception report to Dr. Junior Torres De Castro (PY2BJO) of the Brazilian AMSAT Group, BRAMSAT, the owner of DOVE. Because of the limited length of that frame, about 15 calls will be sent at a time and the message will be changed about every 3 or 4 days. This is the DOVE Ground Command Team's way of thanking everyone who has sent in reports (several hundred at present). Special DOVE QSL cards will also be mailed to those who have reported DOVE reception to PY2BJO. We are particularly interested in hearing about the equipment used and the quality of the signals. We would also like to hear about the use of DOVE signals or data in education. Actual telemetry is not needed at this time.

Please send reports to:

Dr. Junior Torres De Castro (PY2BJO)
119 Macaubal
Sao Palo
Brazil 01254

[The AMSAT News Service would like to thank Jim White (WD0E) and the DOVE Command Team for this bulletin item.]

Antenna Polarization Sense Revisited By WD0E

There have been many discussions occurring on Compuserve's HAMNET forum and in various corners of the amateur radio community about the need for

antenna polarity switching while using the OSCAR satellites. DOVE Command Team member Jim White (WD0E) wants to add some futher comments about this important issue based on his years of experience working with the MICROSATs.

Case For Polarization Switching

"The following is based on design data, direct measurements and experimentation, surveys, and anecdotal evidence from discussion threads on the digital birds and Compuserve. I believe the empirical data is correct, but an error or two could certainly have crept in. I submit it for discussion and comment. The sense (right or left) of the circular polarization of the four original MICROSATs changes depending on the transmitter in use. There was no attempt to make a particular transmitter any sense. The way they came out was based on how the semi-rigid cable and components could be designed into the transmitter module. Here is a list of the sense of each one:

AO-16 RC 437.050 RHCP
AO-16 PSK 437.025 LHCP
DO-17 XMTR A 145.825 LHCP
DO-17 XMTR B 145.825 RHCP
WO-18 RC 437.100 RHCP
WO-18 PSK 437.075
LO-19 RC (&CW) 437.125 RHCP
LO-19 PSK 437.050 LHCP

The AO-16 PSK XMTR and the WO-18 PSK XMTR have problems and are not presently in use (although the AO-16 PSK transmitter - with LHCP - was

IPS RADIO AND SPACE SERVICES AUSTRALIA
Daily Solar And Geophysical Report
Issued at 2330 UT 28 January 1994
Summary for 28 January and Forecast up to 31 January
IPS Warning 02 was issued on 24 January and expires today.

1A. SOLAR SUMMARY
Activity: moderate

Flares Max Fadeout Begin End Freq. Sectors
M1/-- 1852UT none

Observed 10.7 cm flux/Equivalent Sunspot Number : 119/071

1B. SOLAR FORECAST
29 January 30 January 31 January
Activity Low Low Low
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number : 115/066

1C. SOLAR COMMENT
The sunspot group that has been producing the recent low level
M class flares is now on the west limb of the Sun. Another
region has returned to the east limb. This region showed
some magnetic complexity on its past transition but did not
produce any significant flares.

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth : quiet to unsettled

Estimated Indices : A K Observed A Index 27 January
Learmonth 10 3323 3221
Fredericksburg 15 17
Planetary 17 16

2B. MAGNETIC FORECAST
DATE Ap CONDITIONS
29 Jan 12 Quiet to unsettled.
30 Jan 12 Quiet to unsettled.
31 Jan 12 Quiet to unsettled.

2C. MAGNETIC COMMENT
Further active periods from coronal hole do not seem likely.

3A. GLOBAL HF PROPAGATION SUMMARY
LATITUDE BAND
DATE LOW MIDDLE HIGH
28 Jan normal normal normal
PCA Event : None.
3B. GLOBAL HF PROPAGATION FORECAST
LATITUDE BAND
DATE LOW MIDDLE HIGH
29 Jan normal normal fair
30 Jan normal normal fair
31 Jan normal normal fair
3C. GLOBAL HF PROPAGATION COMMENT
NONE.

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
MUFs at Sydney were near predicted monthly values

T index: 41

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
DATE T-index MUFs
29 Jan 40 Near predicted monthly values.
30 Jan 40 Near predicted monthly values.
31 Jan 40 Near predicted monthly values.

Predicted Monthly T Index for January is 30.

4C. AUSTRALIAN REGION COMMENT
None.

Archive-name: radio/rec-radio-info/welcome
Last-modified: $Date: 1994/01/02 22:00 $
Version: $Revision: 1.06 $

*** Welcome to rec.radio.info! ***

Welcome to rec.radio.info, a group that aims to provide a noise-free source
of information and news for the entire rec.radio hierarchy.

Two introductory articles about rec.radio.info are posted to the group and
to news.answers every two weeks. You are now reading the first article, which
explains what rec.radio.info is, and answers some Frequently Asked Questions.
The second article is titled "Submission Guidelines", and you only need to
read it if you want to submit an article to rec.radio.info.

You can skip to the next section of this article by searching for the next
" -- " string. The sections available are:
- What is the purpose of rec.radio.info?
- Why are messages almost always cross posted to rec.radio.info?
- What is a 'follow-up', and what does 'moderated' mean?
- OK, so now I know what 'moderated' means. Tell me more.
- What type of material is considered inappropriate?
- I do not have access to news, how can I get the information posted to
rec.radio.info?
- Will the material appearing in rec.radio.info be archived somewhere?
- I have a regular posting with timely information, is there a way to
speed up it's delivery, or automate for more convenience?

-- What is the purpose of rec.radio.info?

The purpose or charter of rec.radio.info is to provide the Usenet community with
a resource for information, news, and facts about any and all things radio.

All the other rec.radio groups are intended for discussions and general chit
chat about radio. Rec.radio.info will contain informational, factual articles
only. Follow-ups are redirected to an appropriate other group, and further
discussion (if any) will not take place in rec.radio.info.

In order to ensure that rec.radio.info contains only appropriate articles, it
was decided to create the group as a moderated newsgroup.

-- Why are messages almost always cross posted to rec.radio.info?

It provides a "tag" for each article to be assembled into a filtered
presentation in rec.radio.info (even with cross-posting, only one message, with
```

a unique Message-ID, is propogated across the net). This tag also facilitates a pre-existing method of dropping or cancelling the articles locally within the discussion groups if you don't want to see them. This accommodates individuals who want to separate the bulletins from the discussions, discussions from the bulletins, as well as those who are adamant about not reading another newsgroup and wanted to see everything all in one basket.

With the total size of Usenet (in number of newsgroups and total traffic) doubling every year or so, this is no insignificant contribution to reducing information noise and chaos. Making the discussion groups a catch-all, and making extra newsgroups filters on that catch-all, is also the most realistic way to implement such a scheme (It's not intuitively obvious what the charter, contents, and general appropriate topics for each and every newsgroup are. Seeing FAQ's and charter/intro postings in the home newsgroup is beneficial for new readers).

By cross-posting one only is adding a few tens of bytes to each bulletin (to specify the extra group on the Newsgroups line), but are adding the capability for very powerful filtering features available on most news servers, listservers and readers. Your local news guru could probably explain these features in more detail.

In rn, for example, according to Leanne Phillips in her rn kill-file FAQ, add a line of the form:
/Newsgroups:.*[,]rec\.radio\.info/h:j
either in ~/News/KILL (if you don't want to see rec.radio.info articles anywhere) or ~/News/rec/radio/amateur/misc/KILL (if you don't want to see them just in rec.radio.amateur.misc). The latter method means your kill file will only be consulted during rec.radio.amateur.misc (and hence runs more efficiently), and will probably work for most people.

In nn, according to Bill Wohler in his nn FAQ, add a line of the form:
rec.radio.info:!s/:^
in ~/.nn/kill (if you don't want to see rec.radio.info articles anywhere), or put the following lines:
sequence
rec.radio.info
rec.radio.
at the end of ~/.nn/init in order to see all the rec.radio.info bulletins first, then read the remaining rec.radio.* without the bulletins.

-- What is a 'follow-up', and what does 'moderated' mean?

If you are new to Usenet and are not familiar with the terminology, you might want to read the general introductory articles found in the newsgroup news.announce.newusers. Doing so will make your life on the net much easier, and will probably save you from making silly beginner's mistakes.

If you think that at this moment you are reading an echo, a conference, or a bulletin board, I'd also strongly suggest a trip over to news.announce.newusers.

For the rest of this article, I will assume you have a basic knowledge of Usenet terminology and mechanics.

A moderated group means that any article that needs to be posted to the group has to be accepted by the moderator of the group. Since we need to ensure that followups to an article (discussion) do not show up in the rec.radio.info newsgroup, the `Followup-To:' header line contains a newsgroup that is appropriate for disussions about the specific article.

-- OK, so now I know what 'moderated' means. Tell me more.

Rec.radio.info is a moderated newsgroup, which means that all articles submitted to the group will have to be approved by the moderator first.

The current moderator of the group is Mark Salyzyn. Submissions to rec.radio.info can be posted, or e-mailed to:

rec-radio-info@ve6mgs.ampr.ab.ca

Comments, criticisms, suggestions or questions about the group can be e-mailed to:
rec-radio-request@ve6mgs.ampr.ab.ca

But before you do so, please be sure to check out the "Submission Guidelines" article.

The influence of the moderator should be minimal and of an administrative nature, consisting chiefly of weeding out obviously inappropriate articles, while making sure correct headers etc. are used for the appropriate ones.

-- What type of material is considered inappropriate?

There are three broad categories of articles which will be rejected by the moderator:

1) Requests for information: rec.radio.info is strictly a one-way street. I receive information in my mailbox; I then post it to rec.radio.info. Requests for specific information belong in the normal discussion newsgroups. If your request gets answered, you might consider passing the answer on to rec.radio.info, though. Especially if you can edit it into a informational, rather than a discussion, format.

2) Obvious discussion articles, or articles that appear unsubstantiated.

3) Commercial stuff: a relatively unbiased test of a radio product would be accepted, but any hint of for-profit might be reason for rejection. For three reasons: This is not the purpose of the list, for-profit is a controversial topic, and this list may be passed onto Amateur Packet Radio (where for-profit is prohibited except under certain provisos).

rec.radio.swap (or possibly comp.newprod) may be more deserving of the posting in any matter.

Similarly, copyrighted material generally cannot be used. If it's TRULY worthwhile to the net, I would recommend obtaining permission from the copyright holder. Please note the source, and if permission was given. I

reserve the right to make the final decision concerning appropriateness in all situations. In most cases, a brief summary of, or pointer to, the copyrighted information may be all I can allow.

-- I do not have access to news, how can I get the information posted to rec.radio.info?

brian@UCSD.EDU (Brian Kantor) has kindly supplied a mail list server for rec.radio.info. Non of the articles will be digested, due to their size, so you will receive individual mailings for every article posted to the group.

Mail sent to radio-info@ucsd.edu will be forwarded to the moderator and thus is an alias to rec-radio-info@ve6mgs.ampr.ab.ca

To subscribe and unsubscribe via the listserver; the format for that is

sub address radio-info
unsub address radio-info

where 'address' is your full mailing address. Send this request to

listserv@ucsd.edu

Note that the server will automatically delete any address that bounces mail. If you leave the address portion blank, it will try to deduce your address from the mail headers. This may not work if you are on bitnet, milnet or some other non-Unix host, so it is recommended to put your return address in any case. For example:

sub mymailbox@myhost.mydomain.mil radio-info
or
sub MEMEME01@DMBHST.bitnet radio-info

or something like that.

-- Will the material appearing in rec.radio.info be archived somewhere?

Yes. Still firming up details at the moment but here is a preliminary list:
- unbc.edu as maintained by Lyndon Nerenberg <lyndon@unbc.edu>
- nic.funet.fi maintained by Risto Kotalampi <rko@cs.tut.fi>
saved to /pub/dx/text/rec.radio.info currently stored as numbered files.

Effectively this means that anything you post to rec.radio.info will be permanently stored, so your work will not be lost.

-- I have a regular posting with timely information, is there a way to speed up it's delivery, or automate for more convenience?

Yes, there is! It may take a bit of chatter with the moderator, but we are willing to take responsible people and provide them the means of posting the articles directly from their site. We will try everything we can as we fully realize that DX (distant signal) and astronomical data can be somewhat transitory. We are also willing to allow regular posters of information the same courtesy, even if the information is not as time critical.

We refer to this as self-moderation, which is partly based on the model for news.answer. This requires co-operation and good will to be beneficial to the community in the rec.radio hierarchy.

I suggest reading the posting guidelines for more information. I am open to suggestions.

I thank the following individuals for their input into this article:
rec.music.info moderator Leo Breebaart rec-music-info@cp.tn.tudelft.nl
rec.radio.broadcasting moderator Bill Pfeiffer wdp@gagme.chi.il.us
Paul W. Schleck, KD3FU pschleck@unomaha.edu
Ian Kluft, KD6EUI ikluft@uts.amdahl.com

163. APT-Satellites: Report JAN 29, 1994

Newsgroup: rec.radio.amateur.space
Date: 1994-01-31 08:44:51 UTC
From: peter.henne@gmd.de
Message-ID: <1994Jan31.084451.19098@gmd.de>
Source record: 28019
Cross-posted to: rec.radio.amateur.space,rec.radio.info

```
Observed at station 50.7 NLat, 7.1 ELon, JAN 29, 1994

NOAA-9: APT 137.62 On
NOAA-10: APT 137.50 *OFF*
NOAA-11: APT 137.62 On
NOAA-12: APT 137.50 On
Meteor 2-21: APT 137.85 On (weak)
Meteor 3-5: APT 137.30 OFF ???
Meteor 3-6: APT 137.30 *NEW* ON ??

Meteor 3-5 is over the terminator (more or less), so no
APT could be received at my station.
*NEW* Meteor 3-6 (launched JAN 25) was quiet during orbit #57
around 10.30 UT, transmitted APT during orbit #58 descending
at about 12.20 UT and was quiet again orbit #59 around 14.09 UT.
A gif-image of the europe-pass orbit #58 is available for anon ftp
at ftp.gmd.de, dir images/satellites, file M60129first.gif.
The signal was good but seemed to be somewhat overmodulated.
NOAA-10 is off due to VHF-conflict with NOAA-12, should become
active again FEB 01 6.00 UT due to info from wxsat-mail-list.
And: Meteor 2-21 is weak as always.

164. APT-Satellites: Report JAN 29, 1994

Newsgroup: rec.radio.amateur.space
Date: 1994-01-31 10:57:49 UTC
From: peter.henne@gmd.de
Message-ID: <1994Jan31.105749.25009@gmd.de>
Source record: 28015
Cross-posted to: rec.radio.amateur.space,rec.radio.info

SORRY, maybe this is mailed twice:

Observed at station 50.7 NLat, 7.1 ELon, JAN 29, 1994

NOAA-9: APT 137.62 On
NOAA-10: APT 137.50 *OFF*
NOAA-11: APT 137.62 On
NOAA-12: APT 137.50 On
Meteor 2-21: APT 137.85 On (weak)
Meteor 3-5: APT 137.30 OFF ???
Meteor 3-6: APT 137.30 *NEW* ON ??

Meteor 3-5 is over the terminator (more or less), so no
APT could be received at my station.
NEW Meteor 3-6 (launched JAN 25) was quiet during orbit #57
around 10.30 UT, transmitted APT during orbit #58 descending
at about 12.20 UT and was quiet again orbit #59 around 14.09 UT.
A gif-image of the europe-pass orbit #58 is available for anon ftp
at ftp.gmd.de, dir images/satellites, file M60129first.gif,
together with a ascii-description named M60129first.txt
The signal was good but seemed to be somewhat overmodulated.
NOAA-10 is off due to VHF-conflict with NOAA-12, should become
active again FEB 01 6.00 UT due to info from wxsat-mail-list.
And: Meteor 2-21 is weak as always.

166. Mods to 9600 for IC-970

Newsgroup: rec.radio.amateur.space
Date: 1994-02-01 09:30:01 UTC
From: mkl@uwasa.fi
Message-ID: <2il7ep$lpc@zippo.uwasa.fi>
Source record: 28020

I have tried to locate some documents on how to modify my IC-970
to do 9600 bps for satelite use. Could someone mail it, or tell,
me where I could ftp it from?

While I'm at it, has anyone interfaced Trackbox with IC-970? Do
you use the IC-970 serial interface to track dopler shift? If so
should I use RS-232 or TTL signals to talk with my rig?

DOVE (DO-17) Telemetry Watchers Will Be Recognized

This weekend the DOVE (DO-17) Command Team will begin using the DOVE text message frame to transmit the callsigns of everyone who has sent a DOVE reception report to Dr. Junior Torres De Castro (PY2BJO) of the Brazilian AMSAT Group, BRAMSAT, the owner of DOVE. Because of the limited length of that frame, about 15 calls will be sent at a time and the message will be changed about every 3 or 4 days. This is the DOVE Ground Command Team's way of thanking everyone who has sent in reports (several hundred at present). Special DOVE QSL cards will also be mailed to those who have reported DOVE reception to PY2BJO. We are particularly interested in hearing about the equipment used and the quality of the signals. We would also like to hear about the use of DOVE signals or data in education. Actual telemetry is not needed at this time.

Please send reports to:

Dr. Junior Torres De Castro (PY2BJO)
119 Macaubal
Sao Palo
Brazil 01254

[The AMSAT News Service would like to thank Jim White (WD0E) and the DOVE Command Team for this bulletin item.]

Antenna Polarization Sense Revisited By WD0E

There have been many discussions occurring on Compuserve's HAMNET forum and in various corners of the amateur radio community about the need for antenna polarity switching while using the OSCAR satellites. DOVE Command Team member Jim White (WD0E) wants to add some futher comments about this important issue based on his years of experience working with the MICROSATs.

Case For Polarization Switching

"The following is based on design data, direct measurements and experimentation, surveys, and anecdotal evidence from discussion threads on the digital birds and Compuserve. I believe the empirical data is correct, but an error or two could certainly have crept in. I submit it for discussion and comment. The sense (right or left) of the circular polarization of the four original MICROSATs changes depending on the transmitter in use. There was no attempt to make a particular transmitter any sense. The way they came out was based on how the semi-rigid cable and components could be designed into the transmitter module. Here is a list of the sense of each one:

AO-16 RC 437.050 RHCP
AO-16 PSK 437.025 LHCP
DO-17 XMTR A 145.825 LHCP
DO-17 XMTR B 145.825 RHCP
WO-18 RC 437.100 RHCP
WO-18 PSK 437.075
LO-19 RC (&CW) 437.125 RHCP
LO-19 PSK 437.050 LHCP

The AO-16 PSK XMTR and the WO-18 PSK XMTR have problems and are not presently in use (although the AO-16 PSK transmitter - with LHCP - was used for about three years). We normally run XMTR B on DOVE because it is slightly more efficient. Last time I checked LO-19 was being switched occasionally between it's two. So it is strictly coincidence that three of these are RHCP virtually all the time. LO-19 changes. Problems with any of the xmtrs presently in use could result in a switch, which would change their downlinks to LHCP.

As long as you are receiving strong signals from these satellites, a miss-matched sense will not reduce the margin enough to cause missed data. However, if the signal is weak, because of a marginal receive arrangement or low power from the satellite, a miss-matched sense will cause significant loss of data. Uplinks are not a problem because they use monopoles and the receivers are very sensitive.

FO-20 is circular and has a fixed sense both up and down, but because of it's orbit geometry and motion, continuously good signals through it for an entire pass can only maintained if sense is switched, usually several times and on both uplink and downlink. This is particularly noticeable in the analog mode.

On AO-21, the 435 MHz receiving antenna, which is shared by the analog and

digital modes, is a Helix with up to +3 db gain using Right Hand Circular Polarization. The 145 MHz transmitting antenna is a half-wave dipole. These antennas are always earth-pointing due to the satellite's gravity gradient attitude stabilization system. It is clear from a little experimentation and from listening to the DSP FM repeat mode, that changing sense
makes a significant difference in the overall link. At times, it is the difference between being heard and not. It changes during a pass. The UOSAT series use monopole antennas. I have never noticed a difference in link efficiency when sense is switched.

I have no data on which AO-26 transmitter has which sense. But this is a MICROSAT design, so changing transmitters will change sense. In it's first weeks of store and forward operation it was running very low power and incorrect sense made a large difference in received strength during most parts of most passes. If it continues to be necessary to run low power from this satellite, or if the LHCP transmitter is used, left hand sense will be necessary, and switching during a pass may be essential for efficient operation.

AO-27 (EYESAT) uses a monopole for the downlink so sense makes little difference when the amateur transmitter is on high power. However, when receiving very weak signals from it (exciter only), switching sense is necessary to be able to even detect the signal at times. It remains to be seen how much power this bird will be able to sustain on it's amateur (secondary) transmitter, so downlink sense could be an issue. Uplink is not an issue, as a monopole is used with very sensitive receivers.

UNAMSAT is built on a MICROSAT design. It's downlink sense may be left or right depending on which transmitter is used. Downlink power and sense will not be known until this bird is in orbit and becomes operational. During checkout it is likely both transmitters will be used at times, requiring sense switching. Tumbling during the first few days in orbit will almost certainly require switching. Downlink power *could* be somewhat lower than AO-16 and LO-19 because of the power necessary to run the meteor experiment transmitter. This situation would be similar to WO-18, which routinely runs at about half of the power of AO-16 and LO-19 because of the need to support the experiments.

VOXSAT will use monopole antennas, so the link polarization and sense needs may be similar to AO-21.

AO-13: Gain antennas are RHCP. When the satellite is at or near apogee and/or pointing angles are good, RHCP is always best. However, when there is significant off pointing or the omni's are in use, LHCP can often result in better uplink and downlink signals. LHCP can be better both in terms of more strength and reduced depth of spin modulation fade.

Stan Wood (WA4NFY) informs me that Phase-3D will use all RHCP for its circular antennas. Since it will be nadir pointing at all times, sense switching should not be necessary. This assumes all goes as planned, and we certainly hope it does!

I may have left out a bird or two, and have not hit all those being planned. Nor have I attempted to exhaustively document all situations or those of interest only to command stations. However, there are numerous situations in the foregoing where LHCP is necessary or favored. Using the wrong sense will reduce efficiency and/or enjoyment. In a few cases it may make operation impossible. There is certainly much enjoyment available to a satellite enthusiast with fixed RHCP antennas (or even linear). But I hope I have shown that full utilization of our satellite resources requires switchable antenna circularity."

[The AMSAT News Service (ANS) would like to thank Jim White (WD0E) for this bulletin. If you would like to respond to Jim's thoughts on antenna polarization, he can be reached at his INTERNET address of: wd0e@amsat.org.

Also, the ANS would like to thank DB2OS for the information about the AO-21

antennas.]

AMSAT-NA PHASE 3-D TEAM JOINS WITH FLORIDA-BASED ENGINEERING GROUP FOR SPACECRAFT INTEGRATION

About a half dozen members of the North American Phase 3-D Development team met recently to assess overall progress on the program and to begin planning for the spacecraft's final assembly in preparation for its April, 1996 launch from Korou, French Guyana.

Dick Jansson (WD4FAB), AMSAT VP for Engineering, hosted the North American Phase 3-D progress meeting near Orlando, Florida on 7-9 January, 1994, where a number of critical Phase 3-D issues were discussed. While several open items still must be resolved, AMSAT-NA's overall technical contributions to the Phase 3-D project remain on track.

"We're still on schedule for the 1996 launch," said Bill Tynan (W3XO), AMSAT-NA President. "I am really proud of the way everyone on the North American team is pulling together to insure our responsibilites to the international project are met", he said.

The high point of the meeting came when several officers of a Florida-based volunteer group, called Space Frontier Operations (SFO), presented their proposal to manage the overall integration effort for the Phase 3-D spacecraft. After extensive discussions concerning their capabilities and proposed integration approach, SFO's offer was greatfully accepted by Bill Tynan, Dick Jansson, and the rest of AMSAT-NA Phase 3-D team members

present.

Space Frontier Operations is a relatively new group based in the Orlando/Cape Canaveral, Florida area. Presently, their membership stands at about one hundred. They are, however, a rapidly growing, not-for-profit, Florida corporation dedicated to the private, non-commercial, use of space. Their first project was a "Get-Away Special" (GAS Can) experiment which will fly on an upcoming NASA Space Shuttle mission. Most SFO members are also connected professionally to NASA or other space agencies at the Cape. Together, they bring several decades of "hands on" experience designing and building a wide variety of government and commercial space hardware to the Phase 3-D integration effort.

"We are very honored to be associated with such a prestigious group as AMSAT", said Andy Clark, SFO's Chief Executive Officer at the recent Orlando meeting. He went on to note, "We believe our professional aerospace experience will bring another, very positive dimension to an already outstanding international Phase 3-D team." These same feelings were echoed by Mike Peacock (KR4GA), SFO's Director of Engineering, who stated that because SFO and AMSAT share many of the same goals, the partnership should prove mutually benefical.

Also on hand for the meeting were Keith Baker (KB1SF), AMSAT VP, Strategic Planning, who discussed the overall Phase 3-D Master Schedule. In addition, Stan Wood (WA4NFY), udpated the team on Phase 3-D's various antenna designs. Dick Daniels (W4PUJ), AMSAT's North American P3-D Team Director along with Dr. Tom Clark (W3IWI), P-3D GPS experiment Team Leader, joined the group by telephone. Longtime AMSAT satellite builder Jan King, W3GEY, and Lyle Johnson (WA7GXD), from TAPR, were also present and served as technical advisors to both teams during the discussions.

Final designs for solar cells, solar panels, batteries, as well as the progress now being made on the spacecraft's overall structure were also discussed. In addition, possible integration sites in the Orlando/Cape Canaveral area were evaluated and several team members toured a candidate facility at the Orlando International Airport. A final selection regarding the most cost-effective location for Phase 3-D integration will be made once firm rental price proposals are received and evaluated by the now AMSAT-NA/SFO combined Phase 3-D integration team.

[The AMSAT News Service would like to thank Keith Baker (KB1SF) for this bulletin item. Keith can be reached at his Compuserve address of 75070,331.]

Current AMSAT Operations Net Schedule For AO-13

AMSAT Operations Nets are planned for the following times. Mode-B Nets are conducted on AO-13 on a downlink frequency of 145.950 MHz. If, at the start of the OPS Net, the frequency of 145.950 MHz is being used for a QSO, OPS Net enthusiasts are asked to move to the alternate frequency of 145.955 MHz.

Date UTC Mode Phs NCS Alt NCS

06-Feb-94 0530 B 057 W5IU WA5ZIB
12-Feb-94 2200 B 063 W9ODI VE2LVC
20-Feb-94 0200 B 070 WA5ZIB W5IU
28-Feb-94 0430 B 068 WB6LLO W9ODI

Any stations with information on current events would be most welcomed. Also, those interested in discussing technical issues or who have questions about any particular aspect of OSCAR statellite operations, are encouraged to join the OPS Nets. If neither of the Net Control Stations show up, any participant is invited to act as the NCS.

KITSAT-OSCAR-25 Begins Bulletin Board Operations (BBS) 01-FEB-94

KO-25 will open its BBS service beginning on 01-FEB-94. Many discussions are going on about KO-25 services. Thank you for your cooperation so far by keeping your transmitters silent on the KO-25 uplink frequencies so that we could complete our experiments with KO-25. KO-25 will operate in normal mode, 9600 baud FSK using the usual set-up for any of the 9600 baud OSCARS, e.g., KO-23, UO-22, or PoSAT. You will, therefore, not have to make any changes to your station to use KO-25.

Since not all the on board experiments are not finished yet on KO-25, there will be, at times some interruptions of service. But, SaTReC has decided to open the service because the remaining experiments will not cause any serious problems with the KO-25 BBS service.

"We hope you enjoy our new star in space," says Hyungshin Kim of the Korean Institute of Advanced Space Technology.

AO-13 ZRO Tests Begin For '94

AMSAT-OSCAR-13

ZRO TEST SCHEDULE

FEBRUARY-MARCH 1994

The ZRO Memorial Technical Achievement Award Program, or just "ZRO Test" has a

new schedule for February and March, 1994, via AMSAT-OSCAR-13. This activity

is a test of operating skill and equipment performance.

During a typical ZRO run, a control station will send numeric code groups using
CW at 10 words-per-minute. At the beginning of the run, uplink power from the

control station is set to match the general beacon downlink strength. This is

level "zero". The control operator will send and repeat a random five-digit number, then lower his uplink power by 3 dB (half power) and repeat the procedure with a new random number (level "1"). This will continue to a level

30 dB below the beacon (level "A").

A participating listener monitors the downlink signals until he or she can no

longer copy the numbers. Those who can hear the beacon will qualify for the basic award by copying the code group heard at level "zero". The challenge is

to improve home-station performance to a point where the lower-level downlink

signals can be copied (levels 6 through A). To date, only one station, Darrel

Emerson (AA7FV), has successfully copied level "A".

The following schedule of Mode "B" tests were chosen for convenient operating

times and favorable squint angles. The tests can be heard on 145.840 MHz. Andy WA5ZIB will conduct all the tests. Mode "JL" tests will no longer occur

due to the failure of AO-13's 70-cm transmitter.

Day Date (UTC) Time Areas covered

Saturday Feb. 12, 1994 2345 UTC NA, SA, Europe, W. Africa
Sunday Feb. 20, 1994 0330 UTC NA, NW SA, Japan, Pacific
Saturday Feb. 26, 1994 1930 UTC NA, SA, Europe, Africa, ME
Saturday Mar. 19, 1994 1930 UTC NA, SA, Europe, Africa
Saturday Mar. 26, 1994 2315 UTC NA, SA

Note that the dates and days are shown in "UTC", thus the second test occurs at
9:30 PM CST Saturday night (the 19th). Any changes will be announced as soon

as possible via the AMSAT HF and AO-13 Operations Nets.

All listener reports with date of test and numbers copied should be sent to Andy MacAllister WA5ZIB, AMSAT V.P. User Operations, 14714 Knights Way Drive,

Houston, TX 77083-5640. A report will be returned verifying the level of accurate reception. An S.A.S.E. is appreciated but not required.

Information about the AMSAT Awards Program can be found on page 197 of the "Proceedings of the AMSAT-NA Tenth Space Symposium" (1992). This paper, covering all the AMSAT-NA awards including specifics on the ZRO Test, was reprinted on page 10 in the March/April 1993 issue of "The AMSAT Journal". The ZRO Test information provided in the article covers test procedures, means
for obtaining certificates and gives some historical background about the pro-
gram. Reprints of the article can be obtained for an S.A.S.E. to WA5ZIB at the address above.

Happy Birthday AMSAT-OSCAR-21!

On 29-JAN-91 the first international Orbiting Satellite Carrying Amateur Radio

(OSCAR) in which radio amateurs from the former Soviet Union (CIS) worked together with radio amateurs from Germany was successfully launched.

The official name of the project was RM1, which stands for "RADIO M-1". The digital transponder RUDAK-2 is part of RM1.

After the launch from the Northern Cosmodrome in Plesetsk, Russia, the satellite
was named as AMSAT-OSCAR-21, to emphasize that the spacecraft was built by, and for, Radio Amateurs around the world.

AMSAT OSCAR-21 was attached as a secondary payload (Piggy-back) aboard the CIS

geological research satellite "INFORMATOR-1".

AMSAT-OSCAR-21 (also known as RS-14) is a joint project between AMSAT-U in Russia and AMSAT-DL in Germany.

[The AMSAT News Service (ANS) would like to thank DB2OS for this bulletin item.]

[G3RUH/DB2OS/VK5AGR]

FO-20: The following is the current FO-20 operating schedule:
From January '94 thru March '94, the analog mode and the
digital mode will be on alternately for a week at a time.
23-MAR-94 7:52 -TO- 30-MAR-94 8:15 UTC
DIGITAL MODE: Unless otherwise noted above.
[Kazu Sakamoto (JJ1WTK) qga02014@niftyserve.or.jp]

AO-21: ZL3VTV works AO-21 with great success from his QTH in Christchurch, New
Zealand. He reguarly works stations in Australia with ease using a
a fixed 10 element beam pointed 30 deg above the horizon on the uplink

and using a collinear antenna for the downlink. ZL3VTV is looking for
to work more ZL's and would entertain schedules. [ZL3VTV @ZL3AC]

The AMSAT NEWS Service (ANS) is looking for volunteers to contribute weekly
OSCAR status reports. If you have a favorite OSCAR which you work on a
regular basis and would like to contribute to this bulletin, please send
your observations to WD0HHU at his CompuServe address of 70524,2272, on
INTERNET at wd0hhu@amsat.org, or to his local packet BBS in the Denver, CO
area, WD0HHU @ W0LJF.#NECO.CO.USA.NOAM. Also, if you find that the current
set of orbital elements are not generating the correct AOS/LOS times at
your QTH, PLEASE INCLUDE THAT INFORMATION AS WELL. The information you
provide will be of value to all OSCAR enthusiasts.

Source record: 28025

Latest news on the Anik sat. from Ottawa local news is that the problem has been narrowed down to the bird rotating about it's n/s axis once every 2 minutes. The good folks at telsat report that they believe it's possible to stop the motion and keep the ant. pointed at earth by ground controlled firing of the onboard hydrazine rockets. In the event this works it will allow a return to revenue service in about 6 months. I understand this is a massive software task and the knowledge gained is expected to generate a large cash-flow in the future in the event of a similar failure of someone else's bird. The down side of this is that the life expectancy of this relatively new satellite has just gone from 9 to 6 years. On the bright side the Canadian amateur radio country wide uhf link "I.P.A.R.N." has had it's anik channel moved to Anik-2 in only 5 working days, a fine job and many thanks from the Canadian hams.

Hope this is news
Rick

173. Inexpensive GPS

I have been intrested in global positioning. I have seen units for under $600, and pc interface and logging is available. Do the makers of these units pay for the service of the satalites. (Can these signals be received with pc software and receiver or receivers and used for global positioning.) Do GPS units have multiple receivers {3}, or a single receiver that receives timed signals from multiple satalites. I would appreciate any info or source of info on this subject. Or a site that has GPS software.
Thanx$$$

INTERESTED IN THE CURRENT SHUTTLE MISSION
The current mission has a number of interesting aspects: this first Russian astronaut to fly on a shuttle, the 100th GSFC managed Get Away Special payload, as well as planned Shuttle Amateur Radio Experiment activities.

The Goddard Amateur Radio Club (GARC) WA3NAN invites you to tune into Shuttle transmissions. As a public service to the Amateur radio community, the GARC retransmits space shuttle air-to-ground communications. During the STS-60 mission, Amateur radio operators, shortwave listeners, and those individuals with scanners can listen to these communications on the following frequencies:

3.860 MHz (lower sideband)
7.185 MHz (lower sideband)
14.295 MHz (upper sideband)
21.395 Mhz (upper sideband)
28.650 Mhz (upper sideband)

and

147.45 Mhz (FM)

SUMMARY OF ACTIVITY

January 28
Solar activity was moderate, with an M1/SF at 1704UT, and an M1 at
1852UT.
The geomagnetic field at Learmonth (WA) was quiet to unsettled
Ionospheric F2 critical frequencies at Sydney were near predicted
monthly values

January 29
Solar activity was moderate, with an M2 at 0413UT, and an M2 at
1129UT.
The geomagnetic field at Learmonth (WA) was mailnly quiet to
unsettled, with 1 active period
Ionospheric F2 critical frequencies at Sydney were about 15% above
predicted monthly values

January 30
Solar activity was very low.
The geomagnetic field at Learmonth (WA) was quiet to unsettled
Ionospheric F2 critical frequencies at Sydney were mostly 20-35%
above monthly predicted values.

January 31
Solar activity was very low.
The geomagnetic field at Learmonth (WA) was quiet
Ionospheric F2 critical frequencies at Sydney were above 20-30%
above predicted monthly values.

.SK
February 1
Solar activity was very low.
The geomagnetic field at Learmonth (WA) was quiet
Ionospheric F2 critical frequencies at Sydney were near predicted
February values until 09UT, then 15-30% enhanced. Sporadic E may have

affected F layer communications around 17 and 18UT.

February 2
Solar activity was very low.
The geomagnetic field at Learmonth (WA) was quiet to unsettled
Ionospheric F2 critical frequencies at Sydney were 15 to 30% above
predicted monthly values

February 3
Solar activity was low.
The geomagnetic field at Learmonth (WA) was mostly quiet with
unsettled to active conditions 12-21UT
Ionospheric F2 critical frequencies at Sydney were near predicted
monthly values to 30% enhanced during local night.

FORECAST FOR THE NEXT WEEK (4 - 10 FEBRUARY)

SOLAR: low

GEOMAGNETIC: 4-6 Feb quiet to unsettled and an active period is
expected for the 7-11 Feb.

IONOSPHERIC: Near predicted levels to 20% above, then about 15%
below precdicted monthly levels from the 7th-11th Feb.

If you call West Marine at any of their Seattlelocations you can
probably get one of two "brand" name handheld gps, multi-channel
units for $449.00. These give location, elevation, direction and speed
of travel, and bounce quite well. I really don't think you
will do much better than that, since the OEM units are priced to
discourage amateur players like us. They offer less, need more external
support (antennas, software and a laptop or better), but cost more.

Good luck / Mark

>$600, and pc interface and logging is available. Do the makers of these units
>pay for the service of the satalites. (Can these signals be received with
>pc software and receiver or receivers and used for global positioning.)

The cost of the GPS system is paid by all of us through the budget of the
Department of Defense. DoD maintains the satellites and makes navigation
available to the civil community. Who will pay for GPS in the future is
a politically charged, emmotional issue with international implications.
As the system now stands, civil users may purchase receivers that are able
to receive GPS signals that are capable of providing 100 meter accuracy
in 2 dimensions. (Indeed, it's possible to improve this accuracy by
orders of magnitude, but not at the $600 level).

> Do GPS units have multiple receivers {3}, or a single receiver that
>receives timed signals from multiple satalites. I would appreciate any info or
>source of info on this subject. Or a site that has GPS software.

Most inexpensive receivers have a single L-band receiver that receives
range, time, and ephemeral information the satellites (the ephemerides and
time provide a (semi) known satellite location). More expensive receivers
will receive both the L1 and L2 signals transmitted from GPS and can more
accurately account for effects such as ionoshperic delay.

There is also a system called GLONASS which is the Russian version of GPS.

>Thanx$$$

No problem.

IPS RADIO AND SPACE SERVICES AUSTRALIA
Daily Solar And Geophysical Report
Issued at 2330 UT 4 February 1994
Summary for 4 February and Forecast up to 7 February
IPS Warning 03 was issued on 3 Feb and is current for 7-11 Feb.

1A. SOLAR SUMMARY
Activity: very low

Flares: None.

Observed 10.7 cm flux/Equivalent Sunspot Number : 095/043

1B. SOLAR FORECAST
05 February 06 February 07 February
Activity Low Low Low
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number : 095/043

1C. SOLAR COMMENT
None.

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth : mostly quiet with unsettled to
active conditions 12-21UT

Estimated Indices : A K Observed A Index 3 February
Learmonth 10 3111 3431
Fredericksburg 08 10
Planetary 08 10

2B. MAGNETIC FORECAST
DATE Ap CONDITIONS
05 Feb 07 Quiet to unsettled.
06 Feb 07 Quiet to unsettled.
07 Feb 17 Active.

2C. MAGNETIC COMMENT
None.

3A. GLOBAL HF PROPAGATION SUMMARY
LATITUDE BAND
DATE LOW MIDDLE HIGH
04 Feb normal normal normal

PCA Event : None.
3B. GLOBAL HF PROPAGATION FORECAST
LATITUDE BAND
DATE LOW MIDDLE HIGH
05 Feb normal normal normal
06 Feb normal normal normal
07 Feb normal fair poor
3C. GLOBAL HF PROPAGATION COMMENT
NONE.

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
MUFs at Sydney were near predicted monthly values to 15% enhanced
during local night.

T index: 43

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
DATE T-index MUFs
05 Feb 35 Near predicted monthly values.
06 Feb 30 Near predicted monthly values.
07 Feb 0 About 20% below predicted monthly values.

Predicted Monthly T Index for February is 30.

4C. AUSTRALIAN REGION COMMENT
None.

181. RS-14?

Newsgroup: rec.radio.amateur.space
Date: 1994-02-05 14:16:28 UTC
From: bargholzg@vms.csd.mu.edu
Message-ID: <00979988.29C9C4C0@vms.csd.mu.edu>
Source record: 28042

I heard a cw beacon on 145.820. IDing itself as RS14.
Anyone have a Norad number on this, or another name?
Can't find RS14 in the standard Kelp set.

Please Mail direct:
in%"bargholzg@vms.csd.mu.edu"

Thanks, 73 N9UUR Gary

It is free. The U.S. taxpayer funds it (aren't they nice).

>
> Well, forget making a GPS receiver yourself unless you can get a

>

Bilgewater. Sorry Tim, this isn't a flame, honestly. GEC/Plessey produce
a GP1010 / GP1020 chipset which looks like costing about 100 / pair in
quantity, but it is much better than the Motorola (I think?). The GP1010
converts the 1.5 Gigs signal down to a lower frequency digitized version. The
GP1020 has 6 digital 'receivers' (correlators, sometimes implemented in
software). A lot of manufacturers use their own system, Transputers / custom
hardware etc. Time resolution is no problem. The chipset is adjustable and
can be calibrated by it's driver software if enough sats are in view. Time is
just another dimension like x,y,z (lat, long, height).

> My advice is to wait. GPS prices have already halved in the last two years
> and the interfaces (the most important part in my opinion) just keep on

> will see the prices fall even more.
>
> -tim
>

GPSs are already on a 2 piece chipset + processor. The Iridium system
will have GPS receivers built in. I reckon on about $10 for a chipset by 2000.
Easily.

Hi All!

Well, I managed to hear the shuttle's packet radio this morning, but I have no Idea what call sign to connect to. Or for that matter what is the procedure once you do connect. Could someone give a brief tour of connecting to the Shuttle and getting a QSL card?

Also, can I recieve the equivalent of a QSL card for just hearing them?

SB SAREX @ AMSAT $STS-60.007
SAREX Update 2/6 at 00:30 UTC

SAREX was officially activated at 14:27 UTC on February 4 with a successful voice contact through the University of Surrey amateur radio station. Doug Loughmiller, G0SYX was the operator at the microphone to intitate the first contact with the STS-60 crew.

The SAREX team reports a highly successful direct contact one orbit later with a school group in Boise Idaho. The contact, held at the Discovery Center included students from several schools including the Boise Senior High School. 19 students were able to ask direct questions to Shuttle Commander Charlie Bolden.

The packet robot has also been quite active. The packet QSO sequence number exceeded the 800 mark about 30 hours after SAREX operations was initiated.

Problems with RFI on the Wake Shield Facility have delayed the deployment of this primary payload. This has affected the SAREX payload somewhat. Currently, the Mars, Pennsylvania school contact, which was scheduled for today, has been postponed until the Wake Shield issues have been resolved.

The official SAREX element set for today will be GSFC-003. Gil Carman, WA5NOM reports that the predictions using GSFC-003 are 1 second later than the current orbiter state vector.

1 22977U 94006A 94 35.13981770 0.00000202 00000-0 58718-5 0 37

AO-13: Current Transponder Operating Schedule:
L QST *** AO-13 TRANSPONDER SCHEDULE *** 1994 Jan 31-Apr 04
Mode-B : MA 0 to MA 90 |
Mode-BS : MA 90 to MA 120 |
Mode-S : MA 120 to MA 145 |<- S transponder; B trsp. is OFF
Mode-S : MA 145 to MA 150 |<- S beacon only
Mode-BS : MA 150 to MA 180 | Blon/Blat 180/0
Mode-B : MA 180 to MA 256 |
Omnis : MA 230 to MA 30 | Move to attitude 240/0, Apr 04
Poor Sun angle and battery testing need maximum OFF time.
[G3RUH/DB2OS/VK5AGR]

FO-20: The following is the current FO-20 operating schedule:
From January '94 thru March '94, the analog mode and the
digital mode will be on alternately for a week at a time.
ANALOG MODE:
09-FEB-94 7:15 -TO- 16-FEB-94 7:40 UTC
23-FEB-94 8:05 -TO- 02-MAR-94 6:40 UTC
09-MAR-94 7:05 -TO- 16-MAR-94 7:30 UTC
23-MAR-94 7:52 -TO- 30-MAR-94 8:15 UTC
DIGITAL MODE: Unless otherwise noted above.
[Kazu Sakamoto (JJ1WTK) qga02014@niftyserve.or.jp]

AO-21: ZL3VTV works AO-21 with great success from his QTH in Christchurch, New
Zealand. He reguarly works stations in Australia with ease using a
a fixed 10 element beam pointed 30 deg above the horizon on the uplink
and using a collinear antenna for the downlink. ZL3VTV is looking for
to work more ZL's and would entertain schedules. [ZL3VTV @ZL3AC]

The AMSAT NEWS Service (ANS) is looking for volunteers to contribute weekly
OSCAR status reports. If you have a favorite OSCAR which you work on a
regular basis and would like to contribute to this bulletin, please send
your observations to WD0HHU at his CompuServe address of 70524,2272, on
INTERNET at wd0hhu@amsat.org, or to his local packet BBS in the Denver, CO
area, WD0HHU @ W0LJF.#NECO.CO.USA.NOAM. Also, if you find that the current

set of orbital elements are not generating the correct AOS/LOS times at your QTH, PLEASE INCLUDE THAT INFORMATION AS WELL. The information you provide will be of value to all OSCAR enthusiasts.

AO-13 ZRO TEST SCHEDULES!

HR AMSAT NEWS SERVICE BULLETIN 036.05 FROM AMSAT HQ
SILVER SPRING, MD FEBRUARY 6, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-036.05

AO-13 ZRO Tests Begin For '94

AMSAT-OSCAR-13

ZRO TEST SCHEDULE

FEBRUARY-MARCH 1994

The ZRO Memorial Technical Achievement Award Program, or just
"ZRO Test" has a new schedule for February and March, 1994, via
AMSAT-OSCAR-13. This activity is a test of operating skill and equipment
performance.

During a typical ZRO run, a control station will send numeric
code groups using CW at 10 words-per-minute. At the beginning of the
run, uplink power from the control station is set to match the general
beacon downlink strength. This is level "zero". The control operator
will send and repeat a random five-digit number, then lower his uplink
power by 3 dB (half power) and repeat the procedure with a new random
number (level "1"). This will continue to a level 30 dB below the beacon
(level "A").

A participating listener monitors the downlink signals until he
or she can no longer copy the numbers. Those who can hear the beacon
will qualify for the basic award by copying the code group heard at level
"zero". The challenge is to improve home-station performance to a point
where the lower-level downlink signals can be copied (levels 6 through
A). To date, only one station, Darrel Emerson (AA7FV), has successfully
copied level "A".

The following schedule of Mode "B" tests were chosen for convenient
operating times and favorable squint angles. The tests can be heard on
145.840 MHz. Andy WA5ZIB will conduct all the tests. Mode "JL" tests
will no longer occur due to the failure of AO-13's 70-cm transmitter.

Day Date (UTC) Time Areas covered

Saturday Feb. 12, 1994 2345 UTC NA, SA, Europe, W. Africa
Sunday Feb. 20, 1994 0330 UTC NA, NW SA, Japan, Pacific

Saturday Feb. 26, 1994 1930 UTC NA, SA, Europe, Africa, ME
Saturday Mar. 19, 1994 1930 UTC NA, SA, Europe, Africa
Saturday Mar. 26, 1994 2315 UTC NA, SA

Note that the dates and days are shown in "UTC", thus the second test occurs at 9:30 PM CST Saturday night (the 19th). Any changes will be announced as soon as possible via the AMSAT HF and AO-13 Operations Nets.

All listener reports with date of test and numbers copied should be sent to Andy MacAllister WA5ZIB, AMSAT V.P. User Operations, 14714 Knights Way Drive, Houston, TX 77083-5640. A report will be returned verifying the level of accurate reception. An S.A.S.E. is appreciated but not required.

Information about the AMSAT Awards Program can be found on page 197 of the "Proceedings of the AMSAT-NA Tenth Space Symposium" (1992). This paper, covering all the AMSAT-NA awards including specifics on the ZRO Test, was reprinted on page 10 in the March/April 1993 issue of "The AMSAT Journal". The ZRO Test information provided in the article covers test procedures, means for obtaining certificates and gives some historical background about the program. Reprints of the article can be obtained for an S.A.S.E. to WA5ZIB at the address above.

OSCAR-21 CELEBRATES THIRD BIRTHDAY

HR AMSAT NEWS SERVICE BULLETIN 036.04 FROM AMSAT HQ
SILVER SPRING, MD FEBRUARY 6, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-036.04

OSCAR-21 CELEBRATES THIRD BIRTHDAY

On 29 January 1991 the first international Orbiting Satellite Carrying
Amateur Radio (OSCAR) in which radio amateurs from the former
Soviet Union (CIS) worked together with radio amateurs from
Germany was successfully launched.

The official name of the project was RM1, which stands for "RADIO M-1".
The digital transponder RUDAK-2 is part of RM1.

After the launch from the Northern Cosmodrome in Plesetsk, Russia
the satellite was named as AMSAT-OSCAR 21, to emphasize that the
spacecraft was built by, and for, Radio Amateurs around the world.

AMSAT OSCAR-21 is an attached secondary payload (Piggy-back) aboard
the CIS geological research satellite "INFORMATOR-1".

OSCAR-21 (also known as RS-14) is a joint project between AMSAT-U
in Russia and AMSAT-DL in Germany.

Two UUENCODED files which show the RUDAK hardware and two pictures taken from
an original launch video have been uploaded to AMSAT-BB by DB2OS. The picture
is compressed using CJPEG.

ANS thanks Peter Guelzow DB2OS for this item.

AMSAT NET ON GALAXY 3

Satellite users may be interested in an experimentbeing conducted in the Houston, Texas area. The group there is uplinking the Houston Area Amsat Net, heard locally on the 147.10 FM repeater, to Galaxy 3, Channel 17, 5.8 Mhz. audio subcarrier (Shop-At-Home Channel). This net is carried in realtime on Tuesday evening, from approximately 10PM (CST) until completion at approximately 10:30 - 10:45 PM. This is an experiment but could be continued on a regular basis if interest is sufficient. Please send reports of your reception and your comments to: davidsonc@tcd.jsc.nasa.gov via Internet, or call (713) 483-0078 during business hours, or during the uplink period (713) 595-2393. Ask for Craig Davidson, WD5BDX.

ANS wishes to thank Craig Davidson WD5BDX for this information.

STS-60 SAREX Mission Begins

HR AMSAT NEWS SERVICE BULLETIN 036.01 FROM AMSAT HQ
SILVER SPRING, MD FEBRUARY 6, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-036.01

STS-60 News as of 3 February 1994 at 12:30 UTC

The Space Shuttle Discovery made a spectacular, historic, on-time liftoff this morning from the Kennedy Space Center. Discovery's launch marks the first joint U.S.-Russian Space Shuttle Flight. This will be the first of several joint missions planned in preparation for the development of the international Space Station. Cosmonaut Sergei Krikalev, U5MIR, was one of the six crew members on board this morning's Shuttle flight. His fellow American crew mates include Commander Charlie Bolden, KE4IQB, Pilot Ken Reightler, and Mission Specialists Jan Davis, Ron Sega, KC5ETH, and Franklin Chang-Diaz. The primary payloads on-board Discovery are the Wake Shield Facility, which will be deployed and retrieved during the flight and the Spacehab facility. Of particular interest to radio amateurs is the Shuttle Amateur Radio Experiment (SAREX) secondary payload. SAREX information for STS-60 including frequencies, callsigns and Keplerian elements, follows:

STS-60 Shuttle Amateur Radio Experiment (SAREX)
Information Sheet

Mission: STS-60 Space Shuttle Discovery
Wake Shield Facility & Spacehab-2 Mission

Launch: February 3, 1994, 12:10 UTC

Orbit: 57 degree inclination

Mission Length: 8 days (Nominal)

Amateur
Radio
Operators: Charlie Bolden, KE4IQB, Ron Sega, KC5ETH,
Sergei Krikalev, U5MIR

Modes: FM Voice
Prime callsign: KE4IQB

Packet Radio
Callsign: W5RRR-1

Frequencies: All operations in split mode. Do not transmit on
the downlink frequency.

Voice Freqs: Downlink: 145.55 MHz (Worldwide)
Uplinks: 144.91, 144.93, 144.95, 144.97, 144.99 MHz
(Except Europe)
144.70, 144.75, 144.80 MHz (Europe only)

Note: the crew will not favor any specific uplink
frequency, so your ability to work the crew will
be the "luck of the draw"

Packet Freqs: Downlink: 145.55 MHz
Uplink: 144.49 MHz

Info: Goddard Amateur Radio Club, WA3NAN, Greenbelt Maryland,
SAREX Bulletins and Shuttle Retransmissions
3860 KHz, 7185 KHz, 14,295 KHz, 21,395 KHz, 28,650 KHz
and 147.45 MHz (FM)

Johnson Space Center ARC, W5RRR, Houston, Texas
SAREX Bulletins
7225 KHz, 14,280 KHz, 21,395 KHz, 28,650 KHz, (SSB)
and 146.64 MHz (FM)

ARRL Amateur Radio Station, W1AW, Newington, CT
SAREX News Bulletins
3990, 7290, 14,290, 18,160, 21,390, and 28,590 KHz
and 147.555 MHz (FM)

Also, bulletins available on internet, via AMSAT ANS,
Compuserve, and your local PBSS.

School Group Participation: 5 school groups will participate
in SAREX with pre-scheduled direct
and telebridge contacts. These include
4 in the U.S., and one in Russia.

ANS wishes to thank Frank Bauer KA3HDO AMSAT VP for Manned Space Programs for
this information.

Here are two sets of STS-60 SAREX QSL lists (times are UTC) as recorded in the San Francisco Bay Area (the first set by KC6ROL, the second by DL5KR):

Orbit 34:

W5RRR-1>QSL [02/05/93 14:39:21] <UI>:
G0SYX/812 G3RWL/810 VE3AA/809 VE3TIR/808 KB8KPV/805 W7US/802 KB2MVN/800 VE3BDR/796 KG3N/795 N2NRD/794 W2RS/792 VK3ACC/778 VK5AGR/777 VK6ZLK/773 OH9MMN/763

Orbit 50:

W5RRR-1>QSL [02/06/93 15:05:17] <UI>:
WB6FJE/1494 OZ8QI/1481 N9JGQ/1443 KD8SI/1439 K5VAS/1423 W5IU/1419 OE3CV/1382 SM4EFW/1374 OE8PCK/1362 KD4HSL/1296 WP4LBK/1287 LA9QN/1241 VK3YIC/1221 VK2ZW/1217 VK4CHB/1202

Hope you find your call sign in it. Did anyone record a QSL message with numbers in the high 900's (say around #976)?

Best 73,
Manfred --- W6/DL5KR

>I heard a cw beacon on 145.820. IDing itself as RS14.
>Anyone have a Norad number on this, or another name?
>Can't find RS14 in the standard Kelp set.

RS-14 is also known as AO-21, Radio-M1, and RUDAK-2.

It's NORAD number is 21087, and is usually listed with the name
'Informator-1' (which is the actual platform).

It's a very easy satellite to recieve on 2m FM, with another downlink
around 145.990 MHz. (Telemetry, voice, pre-recorded messages).

IPS RADIO AND SPACE SERVICES AUSTRALIA
Daily Solar And Geophysical Report
Issued at 2330 UT 5 February 1994
Summary for 5 February and Forecast up to 8 February
IPS Warning 03 was issued on 3 Feb and is current for 7-11 Feb.

1A. SOLAR SUMMARY
Activity: very low

Flares: None.

Observed 10.7 cm flux/Equivalent Sunspot Number : 093/040

1B. SOLAR FORECAST
06 February 07 February 08 February
Activity Very low Very low Very low
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number : 090/037

1C. SOLAR COMMENT
None.

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth : mostly quiet to unsettled

Estimated Indices : A K Observed A Index 4 February
Learmonth 11 2324 2232
Fredericksburg 18 10
Planetary 18 08

2B. MAGNETIC FORECAST
DATE Ap CONDITIONS
06 Feb 08 Unsettled, active conditions may begin by the end of
today.
07 Feb 16 Active.
08 Feb 20 Active.

2C. MAGNETIC COMMENT
None.

3A. GLOBAL HF PROPAGATION SUMMARY
LATITUDE BAND
DATE LOW MIDDLE HIGH
05 Feb normal normal normal

PCA Event : None.
3B. GLOBAL HF PROPAGATION FORECAST
LATITUDE BAND
DATE LOW MIDDLE HIGH
06 Feb normal normal fair
07 Feb normal fair poor
08 Feb normal fair poor
3C. GLOBAL HF PROPAGATION COMMENT
NONE.

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
MUFs at Sydney were near predicted monthly values to 30% enhanced
during local night.

T index: 50

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
DATE T-index MUFs
06 Feb 40 Near predicted monthly values.
07 Feb 0 About 20% below predicted monthly values.
08 Feb 10 About 15% below predicted monthly values.

Predicted Monthly T Index for February is 30.

4C. AUSTRALIAN REGION COMMENT
None.

IPS RADIO AND SPACE SERVICES AUSTRALIA
Daily Solar And Geophysical Report
Issued at 2330 UT 6 February 1994
Summary for 6 February and Forecast up to 9 February
IPS Warning 03 was issued on 03 Feb and is current
for interval 07-11 Feb.
------------------------------------------------------------

1A. SOLAR SUMMARY
Activity: Very low.

Flares: None.

Observed 10.7 cm flux/Equivalent Sunspot Number : 95/41

1B. SOLAR FORECAST
07 February 08 February 09 February
Activity Very low Very low Very low
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number : 94/40

1C. SOLAR COMMENT
None.
------------------------------------------------------------

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth : storm levels

Estimated Indices : A K Observed A Index 5 February
Learmonth 57 6345 6665
Fredericksburg 41 21
Planetary 55 24

2B. MAGNETIC FORECAST
DATE Ap CONDITIONS
07 Feb 40 Active to minor storm.
08 Feb 25 Active.
09 Feb 20 Active.

2C. MAGNETIC COMMENT
Magnetic activity commenced earlier and was more severe than
expected. This activity is probably due to a coronal hole.
Minor storm periods are expected for today then declining
to active periods over next three days.
```

3A. GLOBAL HF PROPAGATION SUMMARY
LATITUDE BAND
DATE LOW MIDDLE HIGH
06 Feb normal normal fair
PCA Event : None.
3B. GLOBAL HF PROPAGATION FORECAST
LATITUDE BAND
DATE LOW MIDDLE HIGH
07 Feb poor poor poor
08 Feb fair poor poor
09 Feb normal fair poor
3C. GLOBAL HF PROPAGATION COMMENT
Degraded HF comms began yesterday and expected to continue
for today. High lats can expect degraded comms over next
four days.

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
MUFs at Sydney were about 10-20% below predicted monthly values

T index: -4

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
DATE T-index MUFs
07 Feb 0 About 30% below predicted monthly values.
08 Feb 20 About 15% below predicted monthly values.
09 Feb 30 About 10% below predicted monthly values.

Predicted Monthly T Index for February is 30.

4C. AUSTRALIAN REGION COMMENT
Degraded HF comms expected during Feb 7-11.

Here's an interesting problem for you. IT requires a math co-processor if you wish it to run reasonably fast. Off to Fry's for a CP. (IT ran fine on the 386SX as ITNCP) First one was a ULSI co-processor for $65. It scrambles the display and does all sorts of weird things. Usually with sin error messages on the screen. Back to Fry's and go get the ITT (Integrated Information Technologies) co-processor. This one worked like a champ. I remember hearing somewhere that IT requires that the co-processor do more than just deal with floating point addition. And that the inability to do transcendatal operations was what caused the problems with IT and some of the Cheaper co-processor clones. I know that the Intel chip works fine. But thought I would pass this warning on about some of the cheaper chips.

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

SB SAREX @ AMSAT $STS-60.009
SAREX Keps for Feb. 8

The official SAREX element set for today will be GSFC-009. This element set was generated by Ron Parise, WA4SIR of the Goddard Space Flight Center. Gil Carman, WA5NOM reports that the predictions using GSFC-009 differed from GSFC-005 by approximately 11 seconds.

STS-60
1 22977U 94006A 94 38.25534638 0.00000289 00000-0 64918-5 0 90
2 22977 56.9888 199.2675 0009131 272.9026 87.0997 15.72311412 607

Satellite: STS-60
Catalog number: 22977
Epoch time: 94038.25534638 (07 FEB 94 06:07:41.93 UTC)
Element set: GSFC-009
Inclination: 56.9888 deg
RA of node: 199.2675 deg Space Shuttle Flight STS-60
Eccentricity: 0.0009131 Keplerian Elements
Arg of perigee: 272.9026 deg
Mean anomaly: 87.0997 deg
Mean motion: 15.72311412 rev/day Semi-major Axis: 6730.4250 Km
Decay rate: 0.29E-05 rev/day*2 Apogee Alt: 358.18 Km
Epoch rev: 60 Perigee Alt: 345.89 Km

NOTE - This element set is based on NORAD element set # 009.
The spacecraft has been propagated to the next ascending
node, and the orbit number has been adjusted to bring it
into agreement with the NASA numbering convention.

Submitted by Frank H. Bauer, KA3HDO, for the SAREX Working Group

202. STS-60 Eastern R/S Times 02/08

Newsgroup: rec.radio.amateur.space
Date: 1994-02-08 02:51:45 UTC
From: ABFHB@STDVAX.GSFC.NASA.GOV
Message-ID: <$sts-60.010.1994@ampr.org>
Source record: 28056
Cross-posted to: rec.radio.amateur.space,rec.radio.info

SB SAREX @ AMSAT $STS-60.010
STS-60 Eastern R/S Times 02/08

Below are the rise and set times for STS-60 for selected US cities over the next four days. This data was generated to help hams without orbit programs to participate in the SAREX activities. Please note that the times shown are UTC and NOT LOCAL TIME. This listing includes only those passes with an elevation greater than 5 degrees. For information regarding SAREX frequencies and operations procedures, check your local PBBS, or bulletins from W1AW, W5RRR, W6VIO or WA3NAN.

STS-60 will be visible from far northern latitudes for the next several mornings. If a shuttle pass occurs less than one hour before your local sunrise time, but before the morning twilight is too bright, the shuttle will appear as a bright star moving across the sky. If a pass occurs exactly one hour before sunrise, the orbiter may enter daylight while overhead, appearing suddenly out of the darkness.

Symbol key: rise = time that shuttle appears above horizon
tca = time of closest approach to observer
set = time that shuttle disappears below horizon
el = maximium elevation above horizon
geo = geometry: A = Ascending orbit, moving south to north
D = Descending orbit, moving north to south
E = passes east of observer
W = passes west of observer

SB SAREX @ AMSAT $STS-60.011
STS-60 Central R/S Times 02/08

Below are the rise and set times for STS-60 for selected US cities
over the next four days. This data was generated to help hams without
orbit programs to participate in the SAREX activities. Please note that
the times shown are UTC and NOT LOCAL TIME. This listing includes only
those passes with an elevation greater than 5 degrees. For information
regarding SAREX frequencies and operations procedures, check your
local PBBS, or bulletins from W1AW, W5RRR, W6VIO or WA3NAN.

STS-60 will be visible from far northern latitudes for the next several
mornings. If a shuttle pass occurs less than one hour before your local
sunrise time, but before the morning twilight is too bright, the shuttle
will appear as a bright star moving across the sky. If a pass occurs
exactly one hour before sunrise, the orbiter may enter daylight while
overhead, appearing suddenly out of the darkness.

Symbol key: rise = time that shuttle appears above horizon
tca = time of closest approach to observer
set = time that shuttle disappears below horizon
el = maximium elevation above horizon
geo = geometry:B A = Ascending orbit, moving south to north
D = Descending orbit, moving north to south
E = passes east of observer
W = passes west of observer

SB SAREX @ AMSAT $STS-60.013
STS-60 World R/S Times 02/08

Below are the rise and set times for STS-60 for selected worldwide cities
over the next four days. This data was generated to help hams without
orbit programs to participate in the SAREX activities. Please note that
the times shown are UTC and NOT LOCAL TIME. This listing includes only

those passes with an elevation greater than 5 degrees. For information regarding SAREX frequencies and operations procedures, check your local PBBS, or bulletins from W1AW, W5RRR, W6VIO or WA3NAN.

STS-60 will be visible from far northern latitudes for the next several mornings. If a shuttle pass occurs less than one hour before your local sunrise time, but before the morning twilight is too bright, the shuttle will appear as a bright star moving across the sky. If a pass occurs exactly one hour before sunrise, the orbiter may enter daylight while overhead, appearing suddenly out of the darkness.

Symbol key: rise = time that shuttle appears above horizon
tca = time of closest approach to observer
set = time that shuttle disappears below horizon
el = maximium elevation above horizon
geo = geometry: A = Ascending orbit, moving south to north
D = Descending orbit, moving north to south
E = passes east of observer
W = passes west of observer

203. Daily IPS Report - 8 Feb 94

Newsgroup: rec.radio.amateur.space
Date: 1994-02-08 09:59:25 UTC
From: dave@eram.esi.com.au
Message-ID: <5172@eram.esi.com.au>
Source record: 28057
Cross-posted to: aus.radio,rec.radio.amateur.space,rec.radio.info

IPS RADIO AND SPACE SERVICES AUSTRALIA
Daily Solar And Geophysical Report
Issued at 2330 UT 7 February 1994
Summary for 7 February and Forecast up to 10 February
IPS Warning 03 was issued on 03 Feb and is current
for interval 7-11 Feb.

1A. SOLAR SUMMARY
Activity: very low

Flares: none.

Observed 10.7 cm flux/Equivalent Sunspot Number : 096/043

1B. SOLAR FORECAST
08 February 09 February 10 February
Activity Very low Very low Very low
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number : 097/044

1C. SOLAR COMMENT
None.

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth : storm levels during local night.

Estimated Indices : A K Observed A Index 6 February
Learmonth 37 4436 6443
Fredericksburg 43 39
Planetary 65 57

2B. MAGNETIC FORECAST
DATE Ap CONDITIONS
08 Feb 25 Active to minor storm.
09 Feb 20 Active.
10 Feb 20 Active.

2C. MAGNETIC COMMENT
Coronal hole induced magnetic activity continues.

3A. GLOBAL HF PROPAGATION SUMMARY
LATITUDE BAND
DATE LOW MIDDLE HIGH
07 Feb fair-normal fair-normal poor-fair

PCA Event : None.
3B. GLOBAL HF PROPAGATION FORECAST
LATITUDE BAND
DATE LOW MIDDLE HIGH
08 Feb fair poor poor
09 Feb normal fair poor
10 Feb normal fair poor
3C. GLOBAL HF PROPAGATION COMMENT
Magnetic activity continues to degrade HF comms at high
and mid lats.

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
MUFs at Sydney were 10 to 30% below predicted monthly values

T index: -31

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
DATE T-index MUFs
08 Feb 0 About 20% below predicted monthly values.
09 Feb 20 About 15% below predicted monthly values.
10 Feb 40 About 10% below predicted monthly values.

Predicted Monthly T Index for February is 30.

4C. AUSTRALIAN REGION COMMENT
HF comms were degraded on the 7th due to continuing magnetic
activity. Degraded comms are expected until the 11th.
Conditions should be improve slightly later today.

204. shutle frequencies.

Newsgroup: rec.radio.amateur.space
Date: 1994-02-08 15:39:41 UTC
From: dave.champagne@takeone.com
Message-ID: <940208230704545@takeone.com>
Source record: 28058

Can anyone please tell me where I might find the space shutle on HF or on 2M or 70cm. I have found the shutle at 7.185 & 3.860 but it is not to dependable on those freq,s. So if you can help PLEASE DO. and 73. Thanks for reading this message. Dave. VE3QQQ/VE2QQQ/VE3CGK.

205. GPS Information Sources (Revised 5 February 1994)

GPS INFORMATION SOURCES
=======================
| (Revised 5 February 1994; revisions since previous update marked with bar '|')

Prepared by

Richard B. Langley
Geodetic Research Laboratory
| Dept. of Geodesy and Geomatics Engineering
University of New Brunswick
Fredericton, N.B.
Canada E3B 5A3
Phone: (506) 453-5142
Fax: (506) 453-4943
Telex: 014-46202
e-mail: LANG@UNB.CA

Comments and additions to this document are welcome.

1. OFFICIAL CIVILIAN INFORMATION SOURCE
---------------------------------------

GPS INFORMATION CENTER
o Official U.S. Gov't. point of contact for civilian users
o Operated by U.S. Coast Guard
o Voice telephone recording for constellation status: (703) 313-5907
o Computer bulletin board: (703) 313-5910 (up to 14,400
bps) - almanacs, general information, etc.
Available via the Internet through the FedWorld BBS gateway system. Telnet
to fedworld.gov and from the top menu, type DD54 to connect to the GPSIC
BBS. See file GPSIC.VIA.INTERNET.INFO in the CANSPACE file archives (see
below) for more information.
o 24 hour watchstand personnel: (703) 313-5900; fax: (703) 313-5920
o WWV / WWVH shortwave broadcasts - constellation status
o DMA and USCG notices and broadcasts

2. ELECTRONIC INFORMATION SERVICES
----------------------------------

UNITED STATES NAVAL OBSERVATORY
o Responsible for monitoring behaviour of satellite clocks
o Clock data and general information on GPS available
from Automated Data Service (BBS): (202) 653-0155,
-0068, and -1079 (all bit rates); also available via the
Internet (192.5.41.239; anonymous ftp permitted; for telnet
```

connection, log in as ads -- a password is required -- GPS users may
contact Francine Vannicola, fmv@tycho.usno.navy.mil, for the password);
files also available via automated e-mail -- contact Francine Vannicola
for information
o USNO Series 4 mailed weekly bulletins contain satellite
clock info

INTERNATIONAL EARTH ROTATION SERVICE
o System maintained by IERS Central Bureau in Paris
o Earth orientation data from very long baseline interferometry,
laser ranging, and GPS observations
o Sets of space geodesy station coordinates
o UTC leap second announcements
o Access via anonymous ftp: mesiom.obspm.circe.fr (130.84.200.6)

2D SPACE OPERATIONS SQUADRON BBS
o Operated by U.S. Air Force 2d Space Operations Squadron, Falcon AFB, CO
o Service for GPS users from DoD, other U.S. GovUt. agencies, NATO, GovUt.
contractors
o Almanacs, NANUs, Operational Advisories
o DSN 560-6379; (719) 550-6379 (up to 2400 bps; N-8-1)

USAF GPS BBS AT HOLLOMAN AFB, NM
o Operated by U.S. Air Force 6585th Test Group; formerly at Yuma
o Daily almanac, observed range errors, tracking data
o (505) 679-1525 (variety of bit rates)

U.S. ARMY ELECTRONIC PROVING GROUND EGRIS BBS
o Operated by U.S Army
o NANUs, almanac and ephemeris data
o (602) 538-3818 (300 and 1200 bps); (602) 538-3856 (9600 bps)

UNITED KINGDOM CIVIL SATELLITE GROUP ELECTRONIC BBS
o Operated by the University of Nottingham for the Royal Institution of
Navigation
o Full access is only available to members of UKCSG
o +44-602-422111 (2400 bps)

GPSINFO ELECTRONIC VIDEOTEX BBS
o Operated by the Survey Department of Rijkswaterstaat, (the Dutch
Ministry of Transport and Public Works), Delft
o +31-15-561959 (1200 and 2400 bps)

GPS INFO ELECTRONIC BBS
o Operated by Statens Kartverk (the Norwegian Mapping Authority),
Honefoss.
o +47-321-24045 and -18369 (1200 and 2400 bps)

GLOBAL SATELLITE SOFTWARE BBS
o Operated by Global Satellite Software, Inc., San Jose, California
o (408) 252-7358 (300 / 1200 / 2400 bps)

| GIBS - GPS INFORMATIONS- UND BEOBACHTUNGSSYSTEM (INFORMATION AND OBSERVATION
| SYSTEM)
| o Operated by Institut fuer Angewandte Geodasie, Frankfurt/M, Germany
| o +49-69-6333-379 and -418 (up to 19200 bps)
| o Available via Internet: Telnet to no5.ifag.de (141.74.240.25)
| o A GPS status report in German is available at +49 341 5634-380. The
| report is updated at the beginning of each working day.
| o Further information from gibs@no5.ifag.de

GRINEL - PROFESSIONAL ELECTRONICS BBS
o Verwoerdburg, South Africa
| o Operated by Grinel Professional Services on behalf of the Southern Africa
| GPS User Group
o Status advisories, almanac
o +27-12-663-2583 (300 to 2400 bps)
| o According to a report from South Africa dated 4 October 1993, this BBS is
| no longer active

KORT- OG MATRIKELSTYRELSEN BBS
o Kobenhavn, Denmark
o +45-3-185-3541 (up to 2400 bps)

ASSOCIATED CONSULTING INC. BBS
o Las Vegas, Nevada, U.S.A.
o (702) 647-9266 (300/1200/2400 bps)

NATIONAL LAND SURVEY BBS
o Gavle, Sweden
o +46-26-153748 (up to 19200 bps)

AUSLIG GEODESY ELECTRONIC BBS
o Operated by Australian Surveying and Land Information Group
o Constellation status, almanac data, related geodetic information
o +61-6-201-4375 or -4378 (300 to 600 bps)

CANADIAN SPACE GEODESY FORUM
o A LISTSERV-based discussion and information electronic mailing list
o Address of list: CANSPACE@UNB.CA
o Address for further information: LANG@UNB.CA
o File archive in "directory" PUB.CANSPACE on unbmvs1.csd.unb.ca
(131.202.1.2) available by anonymous ftp
| o File archive also available via Gopher;
| URL: gopher://unbmvs1.csd.unb.ca:1570/1EXEC%3aCANSPACE
o Latest DoD NANUs may be obtained by "fingering" gps@geomac.se.unb.ca

OTHER GPS MAILING LISTS
o GPS DIGEST
Moderated by Andy Arkusinski and Ken Jongsma of Smiths Industries, Grand
Rapids, MI.

According to the moderators ...
The GPS Digest is a forum for the discussion of topics related to the USAF
Global Positioning System (GPS) and other satellite navigation positioning
systems. The GPS Digest is moderated and is not presently available via

USENET newsgroup. Submissions should be made to gps@tws4.si.com.
Administrative requests [including requests to be added to the mailing
list] should be made to gps-request@tws4.si.com.
The digests are archived in the CANSPACE file archives.

o GPStech
The GPStech Mailing List
Operated by Jeff Freymueller, Stanford University

Jeff Freymueller has begun an unmoderated mailing list for the discussion
of GPS technical and other issues. The intention is to provide a forum for
the exchange of information, for discussion of the finer technical points
that always seem to trip us up, and for questions about particular GPS
analysis software.

GPStech is intended to be primarily for discussions and
question-and-answer. Hopefully there will soon be several list members who
are experienced with each of the commonly-used software systems, so that
questions can be answered. Any message sent to the list account is
immediately sent out to all members of the list. All messages will be
automatically archived in daily files.

Use the following mail addresses to access the GPStech list:

gpstech@cotopaxi.stanford.edu -- to post a message
gpstech-request@cotopaxi.stanford.edu -- to join or quit the list

USENET
Several USENET news groups have occasional postings related to GPS. Among
them are
o comp.infosystems.gis (gatewayed with the LISTSERV list
GIS-L@UBVM.CC.BUFFALO.EDU)
o rec.aviation.misc
o rec.boats
o sci.space
o sci.space.news
| A new USENET news group, sci.geo.satnav, is in the process of being
| established.

3. PERIODICALS

GPS WORLD MAGAZINE
o Monthly magazine covering the spectrum of GPS usage
| o Current regular subscription rates: US $59, Canada $79, Foreign $117
| o Special subscription rates may be offered from time to time
| o Free subscriptions may still be available for qualified individuals
o Advanstar Communications
P.O. Box 10460
Eugene, Oregon 97440-2460
U.S.A.
Phone: (503) 343-1200
| Fax: (503) 683-8841

Telex: 510-597-0365

GPS WORLD NEWSLETTER
o 6-page newsletter published twice a month by Advanstar Communications
o For subscription information, contact GPS World at the address and phone numbers above

GPS REPORT
o 8-page newsletter containing news and analysis on commercial and military applications of GPS
o Also available electronically via NewsNet and Predicasts
o Phillips Business Information, Inc.
7811 Montrose Road
Potomac, MD 20854
U.S.A.
Phone: (301) 340-2100
Fax: (301) 424-4297
Telex: 358149

CSTG GPS SUBCOMMISSION'S GPS BULLETIN
o Bulletin of the GPS Subcommission under Commission VIII, International Coordination of Space Techniques for Geodesy and Geodynamics of the International Association of Geodesy and the International Union of Geodesy and Geophysics
o Reports on GPS developments related to high accuracy uses of GPS
o Status of the Cooperative International GPS Network (CIGNET)
o GPS Bulletin is prepared and distributed by the National Geodetic Survey, National Oceanic and Atmospheric Administration, U.S. Department of Commerce
o Editor: Miranda Chin
NOAA, N/OES13
1305 East-West Highway
Silver Springs, MD 20910
Phone: (301)713-2852
Fax: (301) 713-4475
e-mail: miranda@gracie.grdl.noaa.gov
| o According to a report received on 9 November 1993, the GPS Bulletin is no
| longer being published.

| GNSS UPDATE
| o Irregular publication of Transport Canada's Global Navigation Satellite
| System Working Group
| o Editor: Deborah Martin
| Transport Canada
| Place de Ville, Tower "C"
| Ottawa, Ontario
| K1A 0N8
| Attention: AANDDB
| Fax: (613) 998-7416

| SATNAV NEWS
| o Quarterly publication on developments at the Federal Aviation

| Administration's Satellite Program Office
| o Available in electronic form from the CANSPACE file archives (see above)

| 6. GPS BIBLIOGRAPHY

A GPS Bibliographic Subscription Service is offered by Canadian GPS Associates, publishers of the Guide to GPS Positioning. This service provides twice-yearly updated editions, listing GPS-related publications from journals, newsletters, reports, and proceedings of GPS-related conferences.

The Premier Edition, issued in late 1992, contained 4,358 entries. This grew from a 1,000-entry bibliography prepared in 1989 at the University of New Brunswick for the U.S. Army Corps of Engineers (Dredging Research Program Technical Report DRP-92-2, available in electronic form as message #5296 on the U.S. Coast Guard's GPS Information Center Bulletin Board). At 8,802 entries, the July 1993 Edition has doubled in size.

The GPS Bibliography is available in both hard-copy and computer-readable form on PC or Macintosh diskettes. The PC diskette version is available in either the standard CSV (comma-separated-variables) text format, or dBase III format. For Macintosh users, the format is tab-separated field text format.

206. Newbie questions on RS-12

Newsgroup: rec.radio.amateur.space
Date: 1994-02-08 16:36:37 UTC
From: karayan@blitzen.cc.bellcore.com
Message-ID: <2j8f2l$gku@blitzen.cc.bellcore.com>
Source record: 28060

Hi! I'm relatively new to ham radio and I'd like to get my hands wet with sats. Since I am a dedicated HF CW fan, I'd like to try the RS-12 sat first. I got very excited when I saw the article in QST about working RS-12. However, the article doesn't get into any kind of detail in terms of the required setup. Sooooo, here are my questions:

1. Is it realistic to work the RS-12 CW robot, or work THROUGH the sat (as a repeater) with a plain dipole? I will have to use the robot up/downlink pair (since I'm a mere tech+) if it matters.

2. Just how strong is the downlink signal? I eagerly searched and searched for the beacon signal (29408+/-) last night, but couldn't hear a thing. (I used my trusty Sony 2010 with a whip, if it matters)

3. Any experiences working the 15m up/ 10m down of the RS-12 sat? Do you HAVE to have megarigs/megayagis? (Or, equivalently: Is there ANY niche in ham radio I can get into without much $$$? ;-) ;-)

4. HOW do I call CQ satellite on CW? Do I send "CQ SAT DE....." or something?

Thanks in advance.

SB SAT @ AMSAT $ANS-039.01
AO-13 OPERATIONS NET SCHEDS

HR AMSAT NEWS SERVICE BULLETIN 039.01 FROM AMSAT HQ
SILVER SPRING, MD FEBRUARY 8, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-039.01

Current AMSAT Operations Net Schedule For AO-13

AMSAT Operations Nets are planned for the following times. Mode-B Nets are conducted on AO-13 on a downlink frequency of 145.950 MHz. If, at the start of the OPS Net, the frequency of 145.950 MHz is being used for a QSO, OPS Net enthusiasts are asked to move to the alternate frequency of 145.955 MHz.

Date UTC Mode Phs NCS Alt NCS

12-Feb-94 2200 B 063 W9ODI VE2LVC
20-Feb-94 0200 B 070 WA5ZIB W5IU
28-Feb-94 0430 B 068 WB6LLO W9ODI

Any stations with information on current events would be most welcomed. Also, those interested in discussing technical issues or who have questions about any particular aspect of OSCAR statellite operations, are encouraged to join the OPS Nets. If neither of the Net Control Stations show up, any participant is invited to act as the NCS.

209. VITA satellite info WANTED

Newsgroup: rec.radio.amateur.space
Date: 1994-02-08 22:42:49 UTC
From: clark@kiwi.gen.nz
Message-ID: <81769.389415290@kiwi.gen.nz>
Source record: 28113

Hello, has anyone heard of or have any information pertaining to the `Vita' satellite? Where would one look to find out as much as one can about `it'?

Is there any S/W out there (pref C code) for tracking such beasties? I believe that it has a polar orbit.

Any _any_ ANY information gratefully received (or pointers to more appropriate newsgroups).

Many thanks... clark

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

212. SAREX Update for Feb 9 at 3:30 UTC

Newsgroup: rec.radio.amateur.space
Date: 1994-02-09 04:04:45 UTC
From: ABFHB@STDVAX.GSFC.NASA.GOV
Message-ID: <$sts-060.014.1994@ampr.org>
Source record: 28116
Cross-posted to: rec.radio.amateur.space,rec.radio.info

SB SAREX @ AMSAT $STS-60.014
SAREX Update Feb. 9 at 03:30 UTC

Three of the five school groups slated for STS-60 have now made successful contacts. The most recent success was with the Mars Middle School, in Mars, Pennsylvania. They contacted the Discovery astronauts through a Telebridge in Texas on orbit number 85. The contact was initiated by Cosmonaut/Shuttle Mission Specialist Sergei Krikalev, U5MIR. Jan Davis then joined in on the school group discussion. A total of 9 students were able to ask questions.

Please note one correction from SAREX bulletin, SB008, regarding the SAREX contact between Sergei, U5MIR, and the school group at the House of Science and Technology for Youth in Moscow, Russia. The Cosmonaut who initiated the contact with Sergei was Musa Manarov, U2MIR. Sorry about the error.

School groups interested in communicating with the Shuttle astronauts are reminded to submit an application and proposal to the ARRL to be considered for a future contact. Final SAREX school group selections are decided approximately 6 months prior to the mission launch date. For more information, please write:

Educational Activities Division
ARRL
225 Main St
Newington, CT 06111

School groups are always welcome to listen into a school group contact when a telebridge contact occurs. We had several schools listening to the Mars, PA contact. For more details on how to listen in through the telebridge, please contact the ARRL at the above address or Frank Bauer, KA3HDO of AMSAT. His e-mail address is ka3hdo@amsat.org

The official SAREX element set for today will be GSFC-011. This element sent was generated by Ron Parise, WA4SIR of the Goddard Space Flight Center. Gil Carman, WA5NOM reports that the predictions using GSFC-011 differed from GSFC-009 by approximately 2 seconds.

STS-60
1 22977U 94006A 94 39.59046866 0.00000351 00000-0 69389-5 0 119
2 22977 56.9887 193.2605 0009224 272.9504 87.0508 15.72376812 813

Satellite: STS-60
Catalog number: 22977
Epoch time: 94039.59046866 (08 FEB 94 14:10:16.49 UTC)

Element set: GSFC-011
Inclination: 56.9887 deg
RA of node: 193.2605 deg Space Shuttle Flight STS-60
Eccentricity: 0.0009224 Keplerian Elements
Arg of perigee: 272.9504 deg
Mean anomaly: 87.0508 deg
Mean motion: 15.72376812 rev/day Semi-major Axis: 6730.2383 Km
Decay rate: 0.35E-05 rev/day*2 Apogee Alt: 358.06 Km
Epoch rev: 81 Perigee Alt: 345.64 Km

NOTE - This element set is based on NORAD element set # 011.
The spacecraft has been propagated to the next ascending
node, and the orbit number has been adjusted to bring it
into agreement with the NASA numbering convention.

Submitted by Frank H. Bauer, KA3HDO, for the SAREX Working Group

213. Help with Instant Track V1.00b

Newsgroup: rec.radio.amateur.space
Date: 1994-02-09 04:28:49 UTC
From: thompson@cactus.org
Message-ID: <1994Feb9.042849.1094@cactus.org>
Source record: 28117

I'm having trouble with the NASA 2-line element sets
when I try to update the elements in Instant Track V1.00b.

I have a patch I installed about 2 years ago to correct
for the + sign/checksum problem.

Have there been any changes in the NORAD format in the last
2 years? Something appears to be different.

Thanks in advance,

Charlie Thompson
Austin, Tx.

214. Daily IPS Report - 9 Feb 94

Newsgroup: rec.radio.amateur.space
Date: 1994-02-09 06:11:13 UTC
From: dave@eram.esi.com.au
Message-ID: <5173@eram.esi.com.au>
Source record: 28118

IPS RADIO AND SPACE SERVICES AUSTRALIA
Daily Solar And Geophysical Report
Issued at 2330 UT 8 February 1994
Summary for 8 February and Forecast up to 11 February
IPS Warning 03 was issued on 03 Feb and is current
until Feb 11.

1A. SOLAR SUMMARY
Activity: Very Low

Flares: None.

Observed 10.7 cm flux/Equivalent Sunspot Number : 095/41

1B. SOLAR FORECAST
09 February 10 February 11 February
Activity Low Low Low
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number : 097/44

1C. SOLAR COMMENT
Previously flaring (M Class) region due to return on 10th February.
This region was declining in area when it rotated from view, but
was still magnetically complex as it transited the west limb.

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth : active to minor storm

Estimated Indices : A K Observed A Index 7 February
Learmonth 29 4445 4452
Fredericksburg 35 45
Planetary 47 54

2B. MAGNETIC FORECAST
DATE Ap CONDITIONS
09 Feb 20 Active.
10 Feb 18 Unsettled to active.
11 Feb 16 Unsettled to active.

2C. MAGNETIC COMMENT
Active periods expected over next three days as coronal hole
disturbance continues.

3A. GLOBAL HF PROPAGATION SUMMARY
LATITUDE BAND
DATE LOW MIDDLE HIGH
08 Feb fair-normal fair poor-fair
PCA Event : None.
3B. GLOBAL HF PROPAGATION FORECAST
LATITUDE BAND
DATE LOW MIDDLE HIGH
09 Feb normal fair poor
10 Feb normal fair poor
11 Feb normal fair poor
3C. GLOBAL HF PROPAGATION COMMENT
NONE.

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
MUFs at Sydney were 10 to 30% below predicted monthly values

T index: -24

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
DATE T-index MUFs
09 Feb 10 10 to 15% below predicted monthly values.
10 Feb 20 10 to 15% below predicted monthly values.
11 Feb 40 10 to 15% below predicted monthly values.

Predicted Monthly T Index for February is 30.

4C. AUSTRALIAN REGION COMMENT
Degraded HF comms conditions were observed yesterday. Conditions
should be marginally better today.

IPS RADIO AND SPACE SERVICES AUSTRALIA
Daily Solar And Geophysical Report
Issued at 2330 UT 9 February 1994
Summary for 9 February and Forecast up to 12 February
IPS Warning 03 was issued on 03 Feb and is current
until Feb 11.

1A. SOLAR SUMMARY
Activity: low

Flares: none.

Observed 10.7 cm flux/Equivalent Sunspot Number : 101/049

1B. SOLAR FORECAST
10 February 11 February 12 February
Activity Low Low to moderate Low to moderate
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number : 103/052

1C. SOLAR COMMENT
Previously flaring region (M class) due to return on 10th February.

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth : active to minor storm levels
observed during local night.

Estimated Indices : A K Observed A Index 8 February
Learmonth 26 3335 4543
Fredericksburg 24 42
Planetary 30 56

2B. MAGNETIC FORECAST
DATE Ap CONDITIONS
10 Feb 20 Unsettled to active.
11 Feb 20 Unsettled to active.
12 Feb 20 Unsettled.

2C. MAGNETIC COMMENT
Magnetic activity should decline over the next couple of days.
Another recurrent disturbance is expected Feb 14-15. This
disturbance is not expected to be as strong as recent activity.

3A. GLOBAL HF PROPAGATION SUMMARY
LATITUDE BAND
DATE LOW MIDDLE HIGH
09 Feb fair-normal fair-normal poor-fair
PCA Event : None.
3B. GLOBAL HF PROPAGATION FORECAST
LATITUDE BAND
DATE LOW MIDDLE HIGH
10 Feb normal fair poor
11 Feb normal fair poor
12 Feb normal fair poor
3C. GLOBAL HF PROPAGATION COMMENT
Propagation conditions should improve over the next few
days. Another disturbed interval expected Feb 14-16.

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
MUFs at Sydney were depressed 20-30% 00-02UT then recovering to near
predicted values.

T index: 21

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
DATE T-index MUFs
10 Feb 25 Near predicted monthly values.
11 Feb 30 Near predicted monthly values.
12 Feb 30 Near predicted monthly values.

Predicted Monthly T Index for February is 30.

4C. AUSTRALIAN REGION COMMENT
Depressions can be expected early on the 10th, however
ionospheric conditions should continue to improve throughout today.
Another disturbed period is expected Feb 14-16.

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

IPS RADIO AND SPACE SERVICES AUSTRALIA
Daily Solar And Geophysical Report
Issued at 2330 UT 10 February 1994
Summary for 10 February and Forecast up to 13 February
IPS Warning 03 was issued on 03 Feb and expires today.

1A. SOLAR SUMMARY
Activity: low

Flares: none.

Observed 10.7 cm flux/Equivalent Sunspot Number : 094/040

1B. SOLAR FORECAST
11 February 12 February 13 February
Activity Low Low to moderate Low to moderate
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number : 090/034

1C. SOLAR COMMENT
Previously flaring region (M class) has yet to appear.

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth : ???

Estimated Indices : A K Observed A Index 9 February
Learmonth 21 3333 5442
Fredericksburg 27 32
Planetary 30 34

2B. MAGNETIC FORECAST
DATE Ap CONDITIONS
11 Feb 20 Active.
12 Feb 20 Active.
13 Feb 20 Active.

2C. MAGNETIC COMMENT
Magnetic activity did not decline as expected, futher active periods
are now expected. Another recurrent disturbance is expected Feb
14-15.

3A. GLOBAL HF PROPAGATION SUMMARY
LATITUDE BAND
DATE LOW MIDDLE HIGH

10 Feb fair-normal fair-normal poor-fair
PCA Event : None.
3B. GLOBAL HF PROPAGATION FORECAST
LATITUDE BAND
DATE LOW MIDDLE HIGH
11 Feb normal fair poor
12 Feb normal fair poor
13 Feb normal fair poor
3C. GLOBAL HF PROPAGATION COMMENT
Propagation conditions are now expected to remain fair for
mid lats and fair-poor at high lats until Feb 16.

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
MUFs at Sydney were about 15% below predicted monthly values

T index: -4

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
DATE T-index MUFs
11 Feb 10 10 to 15% below predicted monthly values.
12 Feb 20 About 10% below predicted monthly values.
13 Feb 20 About 10% below predicted monthly values.

Predicted Monthly T Index for February is 30.

4C. AUSTRALIAN REGION COMMENT
Ionosphere did not recover as expected yesterday, probably due
to continuing magnetic activity. Another disturbed period is
expected Feb 14-16.

4 FEBRUARY - 10 FEBRUARY 1994

Issue No 06
Date of issue: 11 February, 1994

INDICES:
Date 04 05 06 07 08 09 10
10cm 095 093 095 096 095 101 094
A 10 21 39 45 42 32 (27)
T 43 50 -4 -31 -24 21 -4

SUMMARY OF ACTIVITY

February 4
Solar activity was very low.
The geomagnetic field at Learmonth (WA) was mostly quiet with
unsettled to active conditions 12-21UT.
Ionospheric F2 critical frequencies at Sydney were near predicted
monthly values to 15% enhanced during local night.

February 5
Solar activity was very low.
The geomagnetic field at Learmonth (WA) was mostly quiet to unsettled.
Ionospheric F2 critical frequencies at Sydney were near predicted
monthly values to 30% enhanced during local night.

February 6
Solar activity was very low.
The geomagnetic field at Learmonth (WA) was at storm levels.
Ionospheric F2 critical frequencies at Sydney were about 10-20% below
predicted monthly values

February 7
Solar activity was very low.
The geomagnetic field at Learmonth (WA) was storm levels during local
night.
Ionospheric F2 critical frequencies at Sydney were 10 to 30% below
predicted monthly values.

.SK
February 8
Solar activity was very low.
The geomagnetic field at Learmonth (WA) was at active to minor storm
levels.
Ionospheric F2 critical frequencies at Sydney were 10 to 30% below
predicted monthly values.

February 9
Solar activity was very low.
The geomagnetic field at Learmonth (WA) was at active to minor storm
levels observed during local night.
Ionospheric F2 critical frequencies at Sydney were depressed
20-30% 00-02UT then recovering to near predicted values.

February 10
Solar activity was low.
The geomagnetic field at Learmonth (WA) was at active to minor
storm levels during local night.
Ionospheric F2 critical frequencies at Sydney were about 15% below
predicted monthly values.

Comment:
Strong magnetic storm activity was observed during Feb 6-8. This
activity arrived a day earlier than expected and was stronger
than expected. Storm was due to a coronal hole.

FORECAST FOR THE NEXT WEEK (11 - 17 FEBRUARY)

SOLAR: low to moderate

GEOMAGNETIC: active due to coronal hole.

IONOSPHERIC: degraded HF communications expected all week.
MUFs are expected to be 10-15% depressed on IPS predicted
monthly values.

221. STS Downlink

Newsgroup: rec.radio.amateur.space
Date: 1994-02-11 00:10:59 UTC
From: dwetzel@rain.com
Message-ID: <2jeije$r98@rain.psg.com>
Source record: 28125

Does anyone happen to have the actual unified S-Band downlink or TDRS freqs
from the Shuttle?

Thanks!

dwetzel@rain.com

227. Anybody hear the shuttle?

Newsgroup: rec.radio.amateur.space
Date: 1994-02-11 17:17:49 UTC
From: brian@positron.amd.com
Message-ID: <CL2LDr.Hsz@dvorak.amd.com>
Source record: 28131

I've been listening to every early morning pass (3-6am local) and most afternoon passes since the shuttle went up. I've only heard them a few times, and most were very weak. The only strong pass was taken up entirely by one of the astronauts continuously calling some station that obviously never answered him. :-(

I'm using the same setup that I used to get a packet contact with STS-59, so I don't think that's the problem. I'm using the same orbital program that I used then (with updated STS-60 parameters) and my times coincide closely with what is posted for Houston, so I don't think I'm missing the time window.

What gives? I'd like to hear from those of you who've worked the shuttle this time around (or even heard them reliably). What equipment are you using? If you're within a few hundred miles of Austin, Texas, do you find the posted times are good? Are they turning the packet system off at night? It the shuttle oriented the wrong way for their indoor antenna?

Thanks for any answers you can supply...

228. Mode-A questions

Newsgroup: rec.radio.amateur.space
Date: 1994-02-11 19:28:38 UTC
From: tavernin@sun1.interlan.com
Message-ID: <CL2rFs.Fpo@rd1.InterLan.COM>
Source record: 28132

I have a couple of Mode-A questions ...

1. What is the proper way of filling out the frequency info on a QSL card!?

2. Do these contacts count for the VUCC/Satellite award!?

Thanks,

Victor Tavernini / KE4JMY
Racal-Datacom, Inc.

229. Two-Line Orbital Element Sets (TLE341)

Newsgroup: rec.radio.amateur.space
Date: 1994-02-11 22:49:49 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.761006989@afit.af.mil>
Source record: 28133
Cross-posted to: rec.radio.amateur.space,rec.radio.info

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.info.
This week's elements are provided below.

Can anyone help me with working Idaho or Wyoming on satellite?
If you are interested contact me by e-mail and maybe we can set
up a schedule. Any help would be greatly appreciated.

I will respond to all e-mails.

Thanks,

Mark, N8VEA

N0CCZ BECOMES A SILENT KEY

HR AMSAT NEWS SERVICE BULLETIN 043.01 FROM AMSAT HQ
SILVER SPRING, MD FEBRUARY 12, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-043.01

Andy Freeborn (N0CCZ) Becomes A Silent Key

It is with great sadness that AMSAT-NA HQ reports that an old friend of TAPR and AMSAT has become a silent key -- Andy Freeborn (N0CCZ) of Colorado Springs. Andy succumed this past week due to cancer at age 72.

Andy was an Air Force pilot who retired to Colorado Springs where he became an amateur and then later involved in packet radio activities. For a number of years he was a member of TAPR's Board of Directors and he served for a couple of years as the TAPR President. In that role he did yeoman duty for AMSAT coordinating TAPR's involvement in the MICROSAT development and he helped kick off the joint TAPR/AMSAT DSP development activities. Andy will certainly be missed!

[The AMSAT News Service would like to thank Tom Clark (W3IWI) for this bulletin item.]

PHASE-3D FUEL TANKS ARRIVE

HR AMSAT NEWS SERVICE BULLETIN 043.02 FROM AMSAT HQ
SILVER SPRING, MD FEBRUARY 12, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-043.02

Phase-3D Rocket Fuel Tanks Arrive

On February 8, 1994 AMSAT-DL was informed of the arrival of the six tanks for the AMSAT P3-D spacecraft. Each tank is capable of storing about 50 lbs of rocket propellant. The tanks were manufactured in Russia according to AMSAT specifications. AMSAT-DL was able to order and purchase these tanks under very favorable conditions with the help of AMSAT-UA. "The arrival of these tanks constitutes a major milestone in the fabrication of AMSAT's P3-D satellite. It is another shining example of the international cooperation within the P3-D project and amateur radio in general," said Dr. Karl Meinzer (DJ4ZC), AMSAT-DL President and Project Head.

[The AMSAT News Service (ANS) would like to thank Peter Guezlow (DB2OS), AMSAT P3-D Project Team Member, for this bulletin.]

AMSAT Turns 25 Years Old Soon; WA0PTV Is Preparing AMSAT Journal Issue

This spring AMSAT will turn the quarter century mark. The AMSAT Journal Editor, John Hansen (WA0PTV) is already starting to prepare an AMSAT Journal for this historic occasion. He would very much like to hear from the users of OSCAR satellites about what they feel should be included in this historic issue. He is particularly interested to hear from those who wish to contribute information, photos, or articles to this issue of the AMSAT Journal. This 25th "birthday" issue will be published as the March/April issue of The AMSAT Journal. If you feel that you would like to contribute to this "birthday" issue, please contact WA0PTV at either his INTERNET mail address of wa0ptv@amsat.org or to his home address, 49 Maple Avenue, Fredonia, NY, 14063.

Current AMSAT Operations Net Schedule For AO-13

AMSAT Operations Nets are planned for the following times. Mode-B Nets are conducted on AO-13 on a downlink frequency of 145.950 MHz. If, at the start of the OPS Net, the frequency of 145.950 MHz is being used for a QSO, OPS Net enthusiasts are asked to move to the alternate frequency of 145.955 MHz.

Date UTC Mode Phs NCS Alt NCS

20-Feb-94 0200 B 070 WA5ZIB W5IU
28-Feb-94 0430 B 068 WB6LLO W9ODI

Any stations with information on current events would be most welcomed. Also, those interested in discussing technical issues or who have questions about any particular aspect of OSCAR statellite operations, are encouraged to join the OPS Nets. If neither of the Net Control Stations show up, any participant is invited to act as the NCS.

ITAMSAT-OSCAR-26 (IO-26) Returns To Service

After the software crash occurred on the 07-DEC-93, the ITAMSAT (IO-26) Command Team decided to delay the reloading of the code inorder to improve the onboard software and further analyze the Whole Orbit Data (W0D) dumps, to better understand the satellite motion and operation. On the 06-JAN-94, the final version of the code was validated by the Command Team and the BBS was re-opened to all the users. The integrated housekeeping software (IHT ver 2.1) now has WOD capabilities and weekly data dumps will be taken without affecting the BBS operations. It should be remembered by all users that the BBS call sign is ITMSAT-11 for receiving broadcasts and ITMSAT-12 for uploads. Also, the standard PB and PG ground software is needed for accessing the BBS. The downlink frequency is 435.867 MHz using PSK at 1200 baud. Albert Zagni (I2KBD), ITAMSAT Command Team member wishes everyone to "Enjoy ITAMSAT!"

OSCAR Straight Key Night Shows Off The "BEST FISTS"

Many thanks to all who participated in the 22nd Annual Straight Key Night on the OSCARs, 1-JAN-94. The following "Best Fist" nominations have been received: W1NU, WQ3Y and W6HDO. Although AMSAT didn't ask that logs be submitted, several participants also reported working AMSAT-NA's esteemed President, W3XO/5, in one of Bill Tynan's rare appearances on CW (PVRC members especially will appreciate the significance of this occasion). An "honorary" Best Fist nomination goes to you, Bill; let's hope that more SSB operators will follow your fine example, dust off their old pump handles, and enjoy the fun. See you all next year!

STS-60 SAREX Post Flight Synopsis

The first Shuttle Amateur Radio Experiment (SAREX) flight of 1994 can be considered a resounding success. The STS-60 Space Shuttle Discovery mission, which included Astronauts Charlie Bolden, KE4IQB, Ron Sega, KC5ETH, and Russian Cosmonaut Sergei Krikalev, U5MIR concluded on Friday February 11 with a picture perfect touchdown at the Kennedy Space Center. During the mission, nearly 4000 packet connections were made with the SAREX station on Discovery by ham radio operators on the ground. Several voice contacts were also made, primarily late in the mission. True U.S.-Russian cooperation was demonstrated on this flight through on-board experimentation and operation of the SAREX station.

SAREX was officially activated at 14:27 UTC on February 4 with a successful voice contact through the University of Surrey amateur radio station. Doug Loughmiller, G0SYX was the control operator to initiate this first contact with the STS-60 crew.

A highly successful direct contact was completed one orbit later with a school group in Boise Idaho. The contact, held at the Discovery Center included students from several schools including the Boise Senior High School. 19 students were able to ask direct questions to Shuttle Commander Charlie Bolden.

One of the SAREX mission highlights occurred at 10:42 UTC on February 6. Sergei Krikalev, U5MIR, initiated a contact with a school group at the House of Science and Technology for Youth in Moscow, Russia. This represents the first time a cosmonaut on a U.S. space shuttle has communicated with a group in Russia. Leo Lebutin, UA3CR and Valery Agabekov, UA6HZ were the prime school group coordinators for this contact. During the contact Musa Manarov, U2MIR, gave Sergei greetings from Russia. Six students were able to ask their questions to the crew on the Space Shuttle Discovery. In addition, several cosmonauts were on hand to hear the communications. The SAREX contact was also broadcast live throughout Russia on HF (80 meters, 40 meters and 20 meters) as well as on VHF.

Problems with the Wake Shield Facility primary payload affected the SAREX payload somewhat. The Mars, Pennsylvania school contact, had to be rescheduled 4 times before a successful contact was made. 8 students were able to ask questions to Sergei Krikalev and Jan Davis during this contact. The students and teachers should be commended for their persistence and patience.

Other scheduled contacts included the Chariton High School, in Chariton, Iowa, where 3 questions were answered and the James Bean School in Sidney, Maine, where 11 students asked questions to the crew on Discovery.

The following packet message was received by AMSAT member Doug Howard, KG5OA, during one of the last SAREX passes:

[2/10/94 12:11:21]W5RRR-1>QST:
Greetings from Discovery on our sixth day in orbit. We enjoyed a conversation with President Clinton while he was visiting Houston Mission Control yesterday This morning we talked with our colleagues on Mir via satellite and we hope to talk with the Mir cosmonauts today with SAREX. Thanks for your interest and support of our flight. Best wishes from the crew of STS-60.

FYI, unfortunately the Shuttle crew was unsuccessful in their attempts to communicate with the MIR crew using SAREX.

Those of you who have heard or worked the STS-60 crew and wish to receive a QSL card need to send your signal report and an SASE or an envelope and IRCs to the following address:

STS-60 QSL
Education Activities Division
ARRL
225 Main St
Newington, CT 06111

School groups interested in communicating with the Shuttle astronauts are reminded to submit an application and proposal to the ARRL to be considered for a future contact. Final SAREX school group selections are decided approximately 6 months prior to the mission launch date. For more information, please write:

Educational Activities Division
ARRL
225 Main St
Newington, CT 06111

School groups are always welcome to listen into a school group contact when a telebridge contact occurs. We had several schools listening to the Mars, PA contact. For more details on how to listen in through the telebridge, please contact the ARRL at the above address or Frank Bauer, KA3HDO of AMSAT. His e-mail address is ka3hdo@amsat.org

The next SAREX flight, STS-59 is scheduled for April 7. It will be a high inclination (57 degree) mission with voice and packet on-board.

Submitted by Frank H. Bauer, KA3HDO for the SAREX Working Group

WEEKLY OSCAR STATUS REPORTS

HR AMSAT NEWS SERVICE BULLETIN 043.08 FROM AMSAT HQ
SILVER SPRING, MD FEBUARY 12, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-043.08

Weekly OSCAR Status Reports: 12-FEB-94

AO-13: Current Transponder Operating Schedule:
L QST
Mode-B : MA 0 to MA 90 |
Mode-BS : MA 90 to MA 120 |
Mode-S : MA 120 to MA 145 |<- S transponder; B trsp. is OFF
Mode-S : MA 145 to MA 150 |<- S beacon only
Mode-BS : MA 150 to MA 180 | Blon/Blat 180/0
Mode-B : MA 180 to MA 256 |
Omnis : MA 230 to MA 30 | Move to attitude 240/0, Apr 04
Poor Sun angle and battery testing need maximum OFF time.
[G3RUH/DB2OS/VK5AGR]

FO-20: The following is the current FO-20 operating schedule:
From January '94 thru March '94, the analog mode and the
digital mode will be on alternately for a week at a time.
ANALOG MODE:
23-FEB-94 8:05 -TO- 02-MAR-94 6:40 UTC
09-MAR-94 7:05 -TO- 16-MAR-94 7:30 UTC
23-MAR-94 7:52 -TO- 30-MAR-94 8:15 UTC
DIGITAL MODE: Unless otherwise noted above.
[Kazu Sakamoto (JJ1WTK) qga02014@niftyserve.or.jp]

AO-16: Operating normally. [WH6I]

LO-19: Operating normally. [WH6I]

KO-23: Up and running. All appears to be back to normal. [WH6I]

KO-25: BBS is running. It appears that 145.980 MHz is the proper uplink
frequency and the downlink frequency is 436.500 MHz. There are a
number of images on the bird, some in a yet to be described format.
[WH6I]

POSAT: PoSAT is up and running. The processor seems very fast compared
to the other 9600 baud birds and faster through puts are common. A
note on the bird seems to imply that the "amateur experiment" will
be ending soon but no are details available. PoSAT has two uplink
frequencies: 145.925 & 145.975 MHz. The corresponding downlink
frequencies: 435.250 & 435.275 MHz. [WH6I]

IO-26: Is back up and running (1200 baud) and seeing a lot of use. [WH6I]

DOVE: Just a small correction on the address on where to send your DOVE
QSL and shortwave listener reports. PY2BJO reports that if you use
the "extended" zip code for his address, your QSL cards and reports
will arrive sooner. For completeness, his address is as follows:
Dr. Junior Torres De Castro (PY2BJO), 119 Rua Macaubal, Sao Paulo,
Brazil 01256-150. [PY2BJO]

RS-10: With the sudden rise of Solar Flux and 28 MHz open between W and G,
both RS-10 and RS-12 have been giving excellent downlink signals
when well below the user's horizon. GM4IHJ reports hearing the

satellites when over most continents, and DJ8DT reports hearing RS-10's 29.357 MHz beacon when the satellite was overflying Antarctica. Also, ZS6AOP is very active from grid location KG33WV and has made some spectacular contacts on RS-10. He invites all radio amateurs in the surrounding countries to listen for him on RS-10's 10M downlink. [G3IOR & ZS6AOP]

MIR: G3BGM heard MIR working IK1SLD on 144.450 MHz today 03-FEB-94 at 06:21 UTC. The theory about the use of this frequency by the MIR cosmonauts was to avoid clashing with the STS-60 operations. [G3IOR]

The AMSAT NEWS Service (ANS) is looking for volunteers to contribute weekly OSCAR status reports. If you have a favorite OSCAR which you work on a regular basis and would like to contribute to this bulletin, please send your observations to WD0HHU at his CompuServe address of 70524,2272, on INTERNET at wd0hhu@amsat.org, or to his local packet BBS in the Denver, CO area, WD0HHU @ W0LJF.#NECO.CO.USA.NOAM. Also, if you find that the current set of orbital elements are not generating the correct AOS/LOS times at your QTH, PLEASE INCLUDE THAT INFORMATION AS WELL. The information you provide will be of value to all OSCAR enthusiasts.

/EX

238. Landsat Transmissions

Newsgroup: rec.radio.amateur.space
Date: 1994-02-14 10:54:32 UTC
From: boyer@rd.eng.bbc.co.uk
Message-ID: <CL7nMx.5t0@bbc.co.uk>
Source record: 28142

I have seen the orbital elements for Landsat in this group. Does anyone know about the transmissions from this sat. Yes we have all seen the great pickies, but is it at all feasable for 'joe public' to receive and decode the info?

Has anyone got frequecies and info on the modulation?

John B

=========
SpaceNews
=========

MONDAY FEBRUARY 14, 1994

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It is
published every week and is made available for unlimited distribution.

* STS-60/SAREX NEWS *
====================
Gustavo, LW2DTZ, has provided a copy of the packet transmissions he received
from the SAREX experiment carried on Shuttle missiom STS-60 on 06-Feb-94 at
06:56 UTC during a pass over Buenos Aires, Argentina:

W5RRR-1>QST <UI>:
Greetings from the crew of STS-60! Our current altitude is 190 nautOTRO
miles above the beautiful Earth that is the home for all of us. We are
very busy with Spacehab experiments and hopefully today we will deploy
the Wake Shield Facility.

W5RRR-1>QST <UI>:
Best wishes and poka!
Privet to MIR crew
Un afectuoso saludo a todos los radioaficionados hispanoamericanos desde el
transbordador espacial Discovery. Nuestra mision continua en su tercer dia.
hoy logramos avances importantes en la met

W5RRR-1>QST <UI>:
alurgia y la cristalizacion de
proteinas para usos medicos.

W5RRR-1>SAREX <UI>:
This is STS-60 SAREX Robot station W5RRR-1
onboard the Space Shuttle Discovery.

Those who have heard or worked the STS-60 crew and wish to receive a QSL
card need to send your signal report and an SASE or an envelope and IRCs to
the following address:

STS-60 QSL
Education Activities Division

ARRL
225 Main St
Newington, CT 06111
U.S.A.

In other STS-60 news, Yoshiro Yamada at the Yokohama Science Center in Japan reported observing STS-60 at a +1 magnitude on 06-Feb-94 at 05:43 JST from Yokohama.

Although several opportunities were available to see the Shuttle during the early morning hours from the east coast of the United States, observations in some areas were not possible due to thick cloud cover (and heavy snow!).

* DOVE POSTS FIRST CALLS *
==========
The first of 300 callsigns of amateurs who sent telemetry data to Junior PY2BJO in Brazil when DOVE was brought back on the air in December have been posted on the satellite downlink in between engineering data. The following was received by KA3AFY on Friday Feb. 4th, 1994 at 1606 UTC:

DOVE-1>BRAMST [00/00/00 02:38:32]:
4th Feb 1994

DOVE reports have been received from :

AA7WD AB6BC AD4FH CT1DNF CT1EAT CT1EEB
CT1ENC CT1ENQ CT1ERC CT1ETZ CT1EXL CT1EXT

These will change in 4 Days.

[vk7zbx]

Tune into DOVE to see if your call or the call of someone you know shows up on the telemetry being sent on 145.825 MHz. Telemetry data is no longer needed but signal reports, equipment being used to receive DOVE, and DOVE being received in classrooms would be appreciated by BRAMSAT and Junior PY2BJO owner of DOVE. Please send reports to:

Dr. Junior Torres De Castro (PY2BJO)
119 Macaubal
Sao Palo
Brazil 01254

Thanks to Jim White (WD0E) and the DOVE Team for making the bulletin information available. Consult your favorite tracking program or DOVE Watcher for orbit information. Keep your eyes to the skies!

[Info via Larry Lilly, KA3AFY, "DOVE Watcher"]

* ITAMSAT BBS OPENS *
==========
After the software crash occurred on the 7 December, the ITAMSAT (IO-26) Command team decided to delay the reloading of the code, to improve the onboard software and further analyze the Whole Orbit Data dumps, to better

understand the satellite motion and operation. On 06-Jan-94, the final version of the code was validated by the Command team and the BBS re-opened to all users. The housekeeping code (IHT ver 2.1) now has WOD capabilities and weekly data dumps will be taken without affecting the BBS operations. All users are reminded that the BBS callsign is ITMSAT-11 for Broadcast and ITMSAT-12 for uploads, and that the standard PB and PG ground software is needed for accessing the BBS. The downlink frequency is 435.867 MHz using BPSK at 1200 baud.

Enjoy ITAMSAT!

[Info via Alberto, I2KBD, of the ITAMSAT Command Team]

* NEW PICTURE ON AO-21 *
==========
The AO-21 satellite is transmitting a picture showing the launch of the satellite three years ago. The picture is in WEFAX format at 240 lpm. The current operating schedule is available in 1200 bps AFSK packet radio format every 10 minutes on the 145.987 MHz RUDAK-II downlink frequency:

RUDAK2>BEACON <UI>:
RUDAK-II Schedule: (down 145.987, up 435.016)
min/10 Beacon Mode
0..4 FM Repeater
5..7 WEFAX Picture
8..9 AFSK TLM

RUDAK2>BEACON <UI>:
++ Hi, this is the RUDAK-II experiment on AMSAT OSCAR 21 ++

[Info via Gustavo, LW2DTZ]

* OSCAR-13 BANDPASS *
==========
Ever wonder who is active on AMSAT-OSCAR-13? Sergio, IK5AAX, in Italy provides the following bandpass listing for the curious:

OSCAR 13 BANDPASS:

SATURDAY 05:
2238-145924 ZY0SK
2245-145915 A22BW
2312-145897 LI2OWG
2333-145912 8P6SM

SUNDAY 06:
0036-145899 TI5RLI
1904-145884 K4AK
2330-145888 ZY0SK

MONDAY 07:
0018-145899 TU2OJ
0759-145905 Z21HJ

[Info via Sergio, IK5AAX]

* FO-20 OPERATION SCHEDULE *
============================
The FO-20 operation schedule is follows. Analog transponder and digital
transponder will be ON for a week respectively as they were since last
December.

Analog mode:
09-Feb-94 07:15 UTC -to- 16-Feb-94 07:40 UTC
23-Feb-94 08:05 UTC -to- 02-Mar-94 06:40 UTC
09-Mar-94 07:05 UTC -to- 16-Mar-94 07:30 UTC
23-Mar-94 07:52 UTC -to- 30-Mar-94 08:15 UTC

Digital mode:
Unless otherwise noted above.

[Info via Kazu Sakamoto, JJ1WTK]

* THANKS! *

241. Shuttle Scatter???

Newsgroup: rec.radio.amateur.space
Date: 1994-02-14 18:36:51 UTC
From: BILLY@urhep.pas.rochester.edu
Message-ID: <1994Feb14.183651.3989@galileo.cc.rochester.edu>
Source record: 28145

Has anyone tried to make a contact by bouncing a signal off the ionized gasses surrounding the Shuttle as it re-enters? I assume it would work just like meteor-scatter, except it would be predictable. When there is a high-inclination orbit (like 57 degrees), a KSC landing puts the re-entry path over the middle of the US. Anyone want to try a VHF QSO?

-Bill VanRemmen
billy@urhep.pas.rochester.edu
URHEP::billy

My opinions. No one else's. Definitely not the U of R's.

IPS RADIO AND SPACE SERVICES AUSTRALIA
Daily Solar And Geophysical Report
Issued at 2330 UT 14 February 1994
Summary for 14 February and Forecast up to 17 February
IPS Warning 05 will be issued 15 Feb

1A. SOLAR SUMMARY
Activity: very low

Flares: none.

Observed 10.7 cm flux/Equivalent Sunspot Number : 101/049

1B. SOLAR FORECAST
15 February 16 February 17 February
Activity Very low Very low Very low
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number : 100/048

1C. SOLAR COMMENT
None.

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth : unsettled to active, apart from
minor storm levels 15-18UT.

Estimated Indices : A K Observed A Index 13 February
Learmonth 25 4333 4544
Fredericksburg 25 30
Planetary 28 28

2B. MAGNETIC FORECAST
DATE Ap CONDITIONS
15 Feb 25 Unsettled to active levels, with occasional minor
storm periods.
16 Feb 20 Unsettled to active.
17 Feb 20 Unsettled to active.

2C. MAGNETIC COMMENT
None.

3A. GLOBAL HF PROPAGATION SUMMARY
LATITUDE BAND
DATE LOW MIDDLE HIGH

14 Feb fair-normal fair poor
PCA Event : None.
3B. GLOBAL HF PROPAGATION FORECAST
LATITUDE BAND
DATE LOW MIDDLE HIGH
15 Feb fair-normal poor-fair poor
16 Feb normal fair poor-fair
17 Feb normal fair poor-fair
3C. GLOBAL HF PROPAGATION COMMENT
NONE.

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
MUFs at Sydney were near predicted monthly values until 09UT, and
enhanced by 15-30% thereafter.

T index: 48

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
DATE T-index MUFs
15 Feb 50 About 15% above predicted monthly values.
16 Feb 50 About 15% above predicted monthly values.
17 Feb 40 Near predicted monthly values.

Predicted Monthly T Index for February is 30.

4C. AUSTRALIAN REGION COMMENT
Intermittent Sporadic E layer, and continued geomagnetic activity,
may have combined to degrade local propagation conditions yesterday.
Similar conditions are expected for today. Conditions at Townsville
appeared fair to normal yesterday.

243. APT-Satellites: Report FEB 14, 1994

Newsgroup: rec.radio.amateur.space
Date: 1994-02-15 09:12:21 UTC
From: peter.henne@gmd.de
Message-ID: <1994Feb15.091221.15034@gmd.de>
Source record: 28147
Cross-posted to: rec.radio.amateur.space,rec.radio.info

```
Observed at station 50.7 NLat, 7.1 ELon, FEB 14, 1994

NOAA-9: APT 137.62 On
NOAA-10: APT 137.50 On
NOAA-11: APT 137.62 On
NOAA-12: APT 137.50 On
Meteor 2-21: APT 137.85 On (weak)

Signal of Meteor 2-21 seems to become a bit stronger,
but remains weak compared to the other APT-Satellites.
Meteor 3-3, -4, -5 and -6 were inactive. The illumination-
conditions over the northern hemisphere slowly become
better, increasing the vis-contrast (exspecially for
NOAA-9). NOAA-11 drifted to late afternoon, passing
northbound roughly one hour west of the terminator at
50 deg NLat, the right parts of vis-images are quite dim.
```

::
subject: Introduction to Blacknet

Introduction to BlackNet

Your name has come to our attention. We have reason to believe you may be interested in the products and services our new organization, BlackNet, has to offer.

BlackNet is in the business of buying, selling, trading, and otherwise dealing with *information* in all its many forms.

We buy and sell information using public key cryptosystems with essentially perfect security for our customers. Unless you tell us who you are (please don't!) or inadvertently reveal information which provides clues, we have no way of identifying you, nor you us.

Our location in physical space is unimportant. Our location in cyberspace is all that matters. Our primary address is the PGP key location: "BlackNet<nowhere@cyberspace.nil>" and we can be contacted (preferably through a chain of anonymous remailers) by encrypting a message to our public key (contained below) and depositing this message in one of the several locations in cyberspace we monitor. Currently, we monitor the following location: the "Cypherpunks" mailing list (cypherpunks@toad.com).

BlackNet is nominally nondideological, but considers nation-states, export laws, patent laws, national security considerations and the like to be relics of the pre-cyberspace era. Export and patent laws are often used to explicity project national power and imperialist, colonialist state fascism. BlackNet believes it is solely the responsibility of a secret holder to keep that secret--not the responsibilty of the State, or of us, or of anyone else who may come into possession of that secret. If a secret's worth having, it's worth protecting.

BlackNet is currently building its information inventory. We are interested in information in the following areas, though any other juicy stuff is always welcome. "If you think it's valuable, offer it to us first."

- trade secrets, processes, production methods (esp. in semiconductors)
- nanotechnology and related techniques (esp. the Merkle sleeve bearing)
- chemical manufacturing and rational drug design (esp. fullerines and protein folding)
- new product plans, from children's toys to cruise missiles (anything on "3DO"?)
- business intelligence, mergers, buyouts, rumors

BlackNet can make anonymous deposits to the bank account of your choice, where local banking laws permit, can mail cash directly (you assume the risk of theft or seizure), or can credit you in "CryptoCredits," the internal currency of BlackNet (which you then might use to buy _other_ information and have it encrypted to your special public key and posted in public place).

If you are interested, do NOT attempt to contact us directly (you'll be wasting your time), and do NOT post anything that contains your name, your e-mail address, etc. Rather, compose your message, encrypt it with the public key of BlackNet (included below), and use an anonymous remailer chain of one or more links to post this encrypted, anonymized message in one of the locations listed (more will be added later). Be sure to describe what you are selling, what value you think it has, your payment terms, and, of course, a special public key (NOT the one you use in your ordinary business, of course!) that we can use to get back in touch with you. Then watch the same public spaces for a reply.

(With these remailers, local PGP encryption within the remailers, the use of special public keys, and the public postings of the encrypted messages, a secure, two-way, untraceable, and fully anonymous channel has been opened between the customer and BlackNet. This is the key to BlackNet.)

A more complete tutorial on using BlackNet will soon appear, in plaintext form, in certain locations in cyberspace.

Join us in this revolutionary--and profitable--venture.

BlackNet<nowhere@cyberspace.nil>

Archive-name: radio/personal-intro
Revision: 1.5 12/18/93 14:15:53
Changes: new mailing lists, .packet rmgroup, and .policy updates

(Note: The following is reprinted with the permission of the author.)

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info,
and rec.radio.swap newsgroups. It is intended to serve as a guide for the new
reader on what to find where. Questions and comments may be directed to the
author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@oac.hsc.uth.tmc.edu. This message was last changed on 18 September
1993 to add the mailing lists for the new rec.radio.amateur newsgroups, to
note the rmgroup of rec.radio.amateur.packet, and to officially retire some
(in)famous threads of discussion on rec.radio.amateur.policy.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

As the net grew, and as packet radio came into vogue, packet discussion began
to dominate other topics in the group and on the list. This resulted in the
logical solution: a group was created to hold the packet discussion, and
another corresponding mailing list was created as well: net.ham-radio.packet
and PACKET-RADIO, respectively.

These two groups served for several years, and went through Usenet's Great
Renaming essentially unchanged, moving from net.ham-radio[.packet] to
rec.ham-radio[.packet]. Readership and volume grew with the rest of the
network.

The INFO-HAMS mailing list was originally run from a US Army computer at
White Sands Missile Range, SIMTEL20. There were few problems with this
arrangement, but one was that the system was not supposed to be used for
commercial purposes. Since one of hams' favorite pastimes is swapping
gear, it was natural for hams to post messages about equipment for sale
to INFO-HAMS/rec.ham-radio. This ran afoul of SIMTEL20's no-commercial-use
restriction, and after some argument, a group was created specifically
```

for messages like that: rec.ham-radio.swap. This group wasn't gatewayed to a mailing list, thus avoiding problems.

While all this was happening, other folks wanted to discuss other aspects of the world of radio than the personal communications services. Those folks created the rec.radio.shortwave and rec.radio.noncomm newsgroups, and established the precedent of the rec.radio.* hierarchy, which in turn reflected Usenet's overall trend toward a hierarchical name structure.

The debate between proponents of a no-code ham radio license and its opponents grew fierce and voluminous in late 1989 and 1990. Eventually, both sides grew weary of the debate, and those who had not been involved even more so. A proposal for a newsgroup dedicated to licensing issues failed. A later proposal was made for a group that would cover the many recurring legal issues discussions. During discussion of the latter proposal, it became clear that it would be desirable to fit the ham radio groups under the rec.radio.* hierarchy. A full-blown reorganization was passed by Usenet voters in January 1991, leading to the overall structure we now use.

After the reorganization, more and more regular information postings began to appear, and were spread out across the various groups in rec.radio.*. Taking the successful example of the news.answers group, where informational postings from across the net are sent, the group rec.radio.info was created in December, 1992, with Mark Salyzyn, VE6MGS, initially serving as moderator.

In January, 1993, many users started complaining about the volume in rec.radio.amateur.misc. This led to a discussion about a second reorganization, which sparked the creation of a mailing list by Ian Kluft, KD6EUI. This list, which was eventually joined by many of the most prolific posters to the ham radio groups, came up with a proposal to add 11 groups to the rec.radio.amateur hierarchy in April 1993. The subsequent vote, held in May and early June, approved the creation of five groups: rec.radio.amateur.digital.misc (to replace .packet), .equipment, .homebrew, .antenna, and .space.

The Current Groups

I can hear you asking, "OK, so this is all neat history, but what does it have to do with me now?" The answer is that the history of each group has a direct bearing on what the group is used for, and what's considered appropriate where.

The easy one is rec.radio.amateur.misc. It is what rec.ham-radio was renamed to during the reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize

this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, should be removed by September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is now rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there.

The first reorganization added two groups to the list, one of which is rec.radio.amateur.policy. This group was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The other added group is rec.radio.cb. This is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently Mark Salyzyn, VE6MGS. The email address for submissions to the group is rec-radio-info@ve6mgs.ampr.ab.ca. Inquires and other administrivia should be directed to rec-radio-request@ve6mgs.ampr.ab.ca. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas,

commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

IPS RADIO AND SPACE SERVICES AUSTRALIA
Daily Solar And Geophysical Report
Issued at 2330 UT 15 February 1994
Summary for 15 February and Forecast up to 18 February
IPS Warning 05 was issued on 14 Feb and is still current.

1A. SOLAR SUMMARY
Activity: low

Flares: none.

Observed 10.7 cm flux/Equivalent Sunspot Number : 104/053

1B. SOLAR FORECAST
16 February 17 February 18 February
Activity Low Low Low
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number : 105/054

1C. SOLAR COMMENT
None.

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth : unsettled to active, apart from
minor storm levels 12-15UT.

Estimated Indices : A K Observed A Index 14 February
Learmonth 15 3334 5443
Fredericksburg 17 28
Planetary 20 28

2B. MAGNETIC FORECAST
DATE Ap CONDITIONS
16 Feb 20 Unsettled to active levels, with occasional minor
storm periods.
17 Feb 15 Unsettled to active.
18 Feb 10 Unsettled.

2C. MAGNETIC COMMENT
None.

3A. GLOBAL HF PROPAGATION SUMMARY
LATITUDE BAND
DATE LOW MIDDLE HIGH

15 Feb normal fair poor-fair
PCA Event : None.
3B. GLOBAL HF PROPAGATION FORECAST
LATITUDE BAND
DATE LOW MIDDLE HIGH
16 Feb normal fair poor-fair
17 Feb normal normal fair
18 Feb normal normal fair
3C. GLOBAL HF PROPAGATION COMMENT
NONE.

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
MUFs at Sydney were 30-60% enhanced until 06UT, 15-30% enhanced
07-18UT, and near predicted monthly values thereafter.

T index: 72

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
DATE T-index MUFs
16 Feb 30 Near predicted monthly values.
17 Feb 30 Near predicted monthly values.
18 Feb 30 Near predicted monthly values.

Predicted Monthly T Index for February is 30.

4C. AUSTRALIAN REGION COMMENT
Regular Sporadic E layer, and continued geomagnetic activity, may
have combined to degrade local propagation conditions yesterday.
Similar conditions are expected for today. Conditions at Townsville
appeared normal yesterday.

247. Cable Before the PreAmp

Newsgroup: rec.radio.amateur.space
Date: 1994-02-16 11:45:57 UTC
From: seeler@UPEI.CA
Message-ID: <seeler.87.761399157@UPEI.CA>
Source record: 28151

The system I am currently using has two omni directional antennas for 2 meters and 70 cm. The 70 cm antenna is the M Square egg beater and it is up about 20 feet - connected to the rig with Beldin 9913 via N connectors. I do okay on the 9.6 Kb birds: I can copy from an elevation of about 15 degrees (- can hear the bird at 2 degrees elevation) - but the signal is rarelyabove S1.5 on the IC475. Fortunately noise and interference is not a problemhere on the Island. BUT - as soon as it gets above freezing I plan to put a landwehr preamp up at the base of the antenna to improve the stations performance on receive.

My question is this:

What cable/coax should I use for the patch cable between the antenna and preamp. I would like to make the distance as short as possible - but too short and even RG213 will not make the turn to get to the preamp input without distorting the cable's properties. Is a 12 inch run of smaller cable bad news? Should I use a longer run ofRg 213 or 9913? What would have the least impact upon the preamp's performance?

I understand that flexible 9913 is used for the system using yagis - but there the patch cable is probably in excess of 10 feet depending on the setup. - Is flexi 9913 able to make a decent turn - so that a patch cable in an omni system is a reasonable size?

Thank you for any information you might be able to provide me on what is essentially a practical question.

248. Oscar 13 questions

Newsgroup: rec.radio.amateur.space
Date: 1994-02-16 12:29:57 UTC
From: grib@esvx17.es.dupont.com
Message-ID: <1994Feb16.122957.22324@es.dupont.com>
Source record: 28152

Hi All,

As a "newbe" to satellite work, I am in the middle of assembling a Oscar 13 station. I have enough power/preamps/decent rigs for the 2 meter uplink and 435 downling (and vice versa). One thing I'm lacking is antennas for this effort. I already have the elevation rotor so I'm about ready to go. I've been looking into antennas, and need some info regarding them and circular polarization;

a) Is switchable polarization really necessary? Is there a "standard" polarization setting for the Oscar birds?

b) I have diagrams to build quagi's for satellite work. What is the current prices vs building a quagi like. I saw some ad's for KLM antennas, and if I remember correctly, the prices were like $150 + each. Even if I had to build a quagi a year, it would take me quite a bit of time to use up $150 worth of materials!!

c) I saw an article in either Jan or Feb QST regarding 2304 downlinks. Are they used very much? Is it worth the effort and cost to install a 2304 downlink? I live in a rather rural area, so 2 meter interference isn't really a problem here, but was trying to get a idea of the cost vs necessity of getting up on 2304.

Thanks and 73,

Joe KI3B

250. Non-delivery Notification

Newsgroup: rec.radio.amateur.space
Date: 1994-02-16 16:14:54 UTC
From: postmaster@switch.CH
Message-ID: <199402161615.IAA07481@ucsd.edu>
Source record: 28154

Hi ham-space@UCSD.EDU !

this notification concerns your message with

msgid: "<199402101213.EAA01487@ucsd.edu>"

It could not be delivered to the following recipient(s):

hb9boj@hb9eh.ampr.org

In most cases, these delivery problems are caused by spelling errors in the
recipient addresses. This often happens when the FAX-Gateway is addressed.
Its correct addressing is:

X.400: /X121=9xxxxxxxx/ADMD=arcom/C=ch/
RFC-822: /X121=9xxxxxxxx/ADMD=arcom/C=ch/@chx400.switch.ch

Other reasons may be:

- non-authorized use of our gateway to ADMD=arcom: It is open for users with
X.400 addresses "...;PRMD=switch;ADMD=arcom;C=ch" *and* RFC-822 addresses
...@<somedomain>.ch only.

- an incorrectly encoded message envelope: Examples for this are missing
address attributes from some very old EAN versions.

- incorrect timezones in the header's tracing info:
We often see timezone +2900 (29 hours, 0 minutes ahead of Greenwich)
from Solaris 2.3 mailers. Some MTAs (like ADMD=arcom) refuse to accept
such messages. Please install improved sendmail binaries, available via
anonymous ftp from

host: nic.switch.ch
path: software/Solaris/inofficial-patch/sendmail2.3.2.tar.Z

Please contact your local postmaster if you cannot work out the problem
yourself !

postmaster@chx400.switch.ch

Anti spoofing is a system that degrades the GPS fixes of systems that
are not using the classified military codes for accurate, dynamic
navigation. i.e. to prevent anyone from using GPS as a means
of guiding weapons or aiming them.
Presumably 100 m is greater than the blast radius of a terrorist
bomb!

What is anti-spoofing? Does this mean that we are now getting a
scrambled signal? (which I think we've been getting all along?);
or does it mean that the powers-that-be have come to their senses
and turned off the signal jitter?

255. MIR frequencies, AM or FM ?

Hello,
I've heard that the MIR station used the 143.625 MHz for Earth control.
Do you know which mode they use ? AM, FM or SSB ?

Thanks for any info,
Vince (11 weeks and waiting ...)

257. WANTED: Circuit to switch out preamp on transmit

Newsgroup: rec.radio.amateur.space
Date: 1994-02-17 15:58:21 UTC
From: dquaglia@cbnewsj.cb.att.com
Message-ID: <CLDLpE.GG1@cbnewsj.cb.att.com>
Source record: 27911

I'm looking for a circuit that will detect the presence of RF and
switch out a preamp. I only have a transceiver and I would like to
put the preamp on the mast, but I know the preamp will get fried unless
I put some sort of protection on it. I've heard there is a simple
way to do this with PIN diodes, but I can't find any references to this
in any of my usual sources. Any help is appreciated.

11 FEBRUARY - 17 FEBRUARY 1994

Issue No 07
Date of issue: 18 February, 1994

INDICES:
Date 11 12 13 14 15 16 17
10cm 093 098 098 101 104 105 106
A 38 27 30 28 26 16 (12)
T 20 26 36 48 72 41 54

SUMMARY OF ACTIVITY

February 11
Solar activity was very low.
The geomagnetic field at Learmonth (WA) was unsettled 00-09 and
21-24UT, and at storm levels at other times.
Ionospheric F2 critical frequencies at Sydney were near predicted
monthly values, with Sporadic E blanketing at 08UT.

February 12
Solar activity was very low.
The geomagnetic field at Learmonth (WA) was unsettled to active,
apart from minor storm levels 12-15UT.
Ionospheric F2 critical frequencies at Sydney were near predicted
monthly values

February 13
Solar activity was low.
The geomagnetic field at Learmonth (WA) was unsettled to active,
apart from minor storm levels 18-21UT.
Ionospheric F2 critical frequencies at Sydney were near predicted
monthly values until 16UT, apart from enhancements of 15-40% from
11-15UT, and 15-30% depressed from 17UT onwards.

February 14
Solar activity was very low.
The geomagnetic field at Learmonth (WA) was unsettled to active,
apart from minor storm levels 15-18UT.
Ionospheric F2 critical frequencies at Sydney were near predicted
monthly values until 09UT, and enhanced by 15-30% thereafter.

.SK
February 15
Solar activity was very low.
The geomagnetic field at Learmonth (WA) was unsettled to active,

apart from minor storm levels 12-15UT.
Ionospheric F2 critical frequencies at Sydney were 30-60% enhanced
until 06UT, 15-30% enhanced 07-18UT, and near predicted monthly
values thereafter.

February 16
Solar activity was very low.
The geomagnetic field at Learmonth (WA) was unsettled to active
Ionospheric F2 critical frequencies at Sydney were near predicted
monthly values with spread F during local night.

February 17
Solar activity was low.
The geomagnetic field at Learmonth (WA) was quiet to unsettled
Ionospheric F2 critical frequencies at Sydney were 10 to 15% above
predicted monthly values

FORECAST FOR THE NEXT WEEK (18 - 24 FEBRUARY)

SOLAR: low

GEOMAGNETIC: active 20-23 Feb due to a coronal hole

IONOSPHERIC: near predicted monthly values, MUFs are then expected
to be depressed 15-20% during the coronal hole activity

261. Re: It's Official: GPS Anti-spoofing Is Now on Continuously

Newsgroup: rec.radio.amateur.space
Date: 1994-02-18 11:14:55 UTC
From: ae674@yfn.ysu.edu
Message-ID: <2k27vf$86g@news.ysu.edu>
Source record: 27915

:Anti spoofing is a system that degrades the GPS fixes of systems that
:are not using the classified military codes for accurate, dynamic
:navigation. i.e. to prevent anyone from using GPS as a means
:of guiding weapons or aiming them.
:Presumably 100 m is greater than the blast radius of a terrorist
:bomb!

I presume this randomizes the timing signals that are sent and received...
I was under the impression that this had been implemented a while ago.
Or is "anti spoofing" a more secure encryption scheme for the military coded signals?
Having yet to get my hands on a GPS unit, what kind of resolution do the commercial
units offer and what was there accuracy before the "anti spoofing"/signal jitter
system went into effect?

> system went into effect?

Crudely it is a deliberately introduced signal jitter. Up to now with
GPS 'non-operational' the anti-spoof was switched in and out as the
military operations needed it. The official dynamic precision is 100m,
Problem was that technology was advancing too fast and without some
form of deliberate degradion civilian systems even without the secret
timing codes could have accuracies that worried the operators of GPS.
Now the system is operational the operators will make efforts to ensure
that any new improvement in dynamic accuracy is deliberately degraded
back to spec. . Differential GPS that compares two stations, one
a known site is another game of course.

268. Unix tracking program

Newsgroup: rec.radio.amateur.space
Date: 1994-02-18 17:42:29 UTC
From: j2yc@jupiter.sun.csd.unb.ca
Message-ID: <1994Feb18.174229.2315@jupiter.sun.csd.unb.ca>
Source record: 27922

Last year I found a satellite tracking program (w/ source) for unix.
It was menu driven and gave output in the form of a file which gave
azimuth and elevation reading for the times you have entered.

I made modifications to the program to allow it to be run completely
from the command line (such as in a batch environment) however
I have lost not only my modified program and the original program,
I've forgotten the name of the program... eeps

* OSCAR SKN BEST FISTS *
========================
Many thanks to all who participated in our 22nd Annual Straight Key Night
on OSCAR, 1 January 1994. The following "Best Fist" nominations have been
received: W1NU, WQ3Y and W6HDO. Although we didn't ask that logs be
submitted, several participants also reported working AMSAT-NA's esteemed
president, W3XO/5, in one of Bill's rare appearances on CW (PVRC members
especially will appreciate the significance of this occasion). An
"honorary" Best Fist nomination goes to you, Bill; let's hope that more SSB
ops will follow your fine example, dust off their old pump handles, and
enjoy the fun.

See you all next year!

* OSCAR-13 ZRO TEST SKED *
==========
The ZRO Memorial Technical Achievement Award Program, or just "ZRO Test" has a new schedule for February and March, 1994, via AMSAT-OSCAR-13. This activity is a test of operating skill and equipment performance.

During a typical ZRO run, a control station will send numeric code groups using CW at 10 words-per-minute. At the beginning of the run, uplink power from the control station is set to match the general beacon downlink strength. This is level "zero". The control operator will send and repeat a random five-digit number, then lower his uplink power by 3 dB (half power) and repeat the procedure with a new random number (level "1"). This will continue to a level 30 dB below the beacon (level "A").

A participating listener monitors the downlink signals till he can no longer copy the numbers. Those who can hear the beacon will qualify for the basic award by copying the code group heard at level "zero". The challenge is to improve home-station performance to a point where the lower-level downlink signals can be copied (levels 6 through A). To date, only one station (Darrel Emerson, AA7FV) has successfully copied level "A".

The following schedule of Mode "B" tests were chosen for convenient operating times and favorable squint angles. The tests can be heard on 145.840 MHz. Andy WA5ZIB will conduct all the tests. Mode "JL" tests will no longer occur due to the failure of AO-13's 70-cm transmitter.

Day Date (UTC) Time Areas covered

Sunday Feb. 20, 1994 0330 UTC NA, NW SA, Japan, Pacific
Saturday Feb. 26, 1994 1930 UTC NA, SA, Europe, Africa, ME
Saturday Mar. 19, 1994 1930 UTC NA, SA, Europe, Africa
Saturday Mar. 26, 1994 2315 UTC NA, SA

Note that the dates and days are shown in "UTC", thus the first test listed occurs at 9:30 PM CST
announced as soon as possible via the AMSAT HF and AO-13 Operations Nets.

All listener reports with date of test and numbers copied should be sent to Andy MacAllister WA5ZIB, AMSAT V.P. User Operations, 14714 Knights Way Drive, Houston, TX 77083-5640. A report will be returned verifying the level of accurate reception. An S.A.S.E. is appreciated but not required.

Information about the AMSAT Awards Program can be found on page 197 of the "Proceedings of the AMSAT-NA Tenth Space Symposium" (1992). This paper, covering all the AMSAT-NA awards including specifics on the ZRO Test, was reprinted on page 10 in the March/April 1993 issue of "The AMSAT Journal". The ZRO Test information provided in the article covers test procedures,

means for obtaining certificates and gives some historical background about the program. Reprints of the article can be obtained for an S.A.S.E. to WA5ZIB at the address above.

[Info via WA5ZIB]

* DISCOVERY-MIR RADIO LINK *
==========
The Space Shuttle Discovery's crew and the MIR Russian space station made an Amateur Radio contact on 08-Feb-94 during a period of time when Discovery was over the south Pacific and MIR was over the Caribbean.

"We fly during a lot of time with Sergej and I wish a good work with his North American collegues, and a not problems return to the Earth", said Valery Polyakov one of the MIR cosmonauts. "Thanks, I heard you perfect", replied Krikalev in Russian.

[Info via Gustavo, LW2DTZ of AMSAT-LU]

* AMSAT HF PBBS *
==========
WT0N-3 in St. Paul, MN, USA will be on 10.127 LSB (30 meters) Monday through Saturday from 1600 UTC until 23OO UTC. This station will carry all AMSAT bulletins and Keps. It will also carry other satellite related items such as "SpaceNews". This PBBS will be set up on 300 baud HF packet, but will also be available for AMT
to do so. At this time, the PBBS will be set up as an experiment and any comments and suggestions should be directed to the sysop, BJ Arts, WT0N, at any one of the following addresses:

PACKET: WT0N@WB0GDB.#STP.MN.USA.NOAM
INTERNET: BJARTS@STTHOMAS.EDU

[Info via WT0N]

* FO-20 SCHEDULE *
==========
The FO-20 command station announced that a slight malfunction in the onboard command system had been detected. As a result, analog mode operation arranged from 09-Feb-94 will be performed on schedule, but there is a possibility of interruption due to satellite ground station control.

The present schedule is as announced before:

Analog mode:
09-Feb-94 07:15 -to- 16-Feb-94 07:40 UTC
23-Feb-94 08:05 -to- 02-Mar-94 06:40 UTC
09-Mar-94 07:05 -to- 16-Mar-94 07:30 UTC
23-Mar-94 07:52 -to- 30-Mar-94 08:15 UTC

Digital mode: Unless otherwise noted above.

[Info via Kazu Sakamoto, JJ1WTK]

* THANKS! *
==========
Thanks to all those who sent QSL cards, letters, and messages of
appreciation regarding SpaceNews, especially:

>John.boyer@rd.eng.bbc.co.uk

It's something like 85 megabits, which means Joe Public needs a pretty
hefty antenna -- maybe 10 m.

271. EOSS Balloon Flight In Denver

Newsgroup: rec.radio.amateur.space
Date: 1994-02-18 22:37:50 UTC
From: rickvg@cscns.com
Message-ID: <-CKPjSEHGkfN057yn@cscns.com>
Source record: 27925
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.space,rec.radio.amateur.digital.misc,rec.radio.shortwave

For Followups to this post check the newsgroup rec.radio.amateur.space

Edge of Space Sciences, Inc. (EOSS) is a non-profit organization comprised of individuals interested in the use of high altitude balloon flights to offer an experimental platform for students and other experimenters. The group has a very high level of participation by amateur radio operators, however, this is NOT a requirement for membership and participation.

EOSS has flown 14 successful flights over the past few years. We regularly fly amateur television, and a suite of atmospheric sensors.

Other experimental payloads have included, GPS and LORAN-C for a comparison of their accuracy. Homebrew differential GPS on the same flight. Students of Coloraro University at Boulder (CU) created their own differential system using a gps receiver at a KNOWN location, and calculated the offsets themselves, allowing the GPS vs. LORAN-C comparison greater accuracy.

EOSS hosted last year's "National Balloon Symposium" in Denver Colorado. People from more than 10 states, and Canada were in attendance as well as some of the commercial providers of equipment used in our "hobby".

We plan to fly EOSS-15 soon and here is our general information release about this flight. If you have any questions about the flight or EOSS please use email to my address (sig file at bottom).

EOSS-15 FLIGHT PROFILE

LAUNCH SITE:
Thunder Ridge Middle School
Picadilly and Smokey Hill Rd.
Aurora, Colorado, USA

latitude 39.61195 deg North
longitude 104.75050 deg West

(The lat/lon is actually for a location within 1 mile of launch point. I haven't been to the launch site to take an accruate fix yet.)

LAUNCH DATE: February 26,1994

LAUNCH TIME: 1600 UTC (Set up 1400 UTC) Launch time subject to FAA approval

ON-BOARD EXPERIMENT: Conducted by Cherry Creek High School.

PURPOSE: To measure the various levels of alpha, beta, and gamma radiation at various altitudes.

SHUTTLE FREQUENCIES:
Packet: 144.340
ATV: 426.250
CW Beacon: 147.555
Carries the call of WB4ETT

There will be a HF net run by Sparky\ KA0DPC on 7.232 MHz (phone). And the FOXHUNTER'S will coordinate on the Colorado Repeater Association's repeater 147.225 MHz (+600kHz). This will also be used for some local information during the flight. Thanks in advance to the Colorado Repeater Association for the use of their repeater.

REMARKS: Edge of Space Sciences will provide the platform for Cherry Creek High School and Thunder Ridge Middle School to study the lower atmosphere. Cherry Creek H.S. students have modified a geiger counter to meet the EOSS interface specifications which will measure the alpha, beta, and gamma levels of radiation vs. altitude. The experiment will gather data that should interest local NASA and NOAA officials.

Thunder Ridge M.S. students will make graphs that will help them understand the temperature vs. altitude and balloon dynamics by graphing the ascent and descent rate of the balloon.

The project will be presented at this years Denver, News 4 Education Exposition at the Colorado Convention Center on March 11,12,13 1994. More information about the EXPO can be obtained from EOSS.

Sponsorship for this flight and Education Exposition have been provided by:

IPS RADIO AND SPACE SERVICES AUSTRALIA
Daily Solar And Geophysical Report
Issued at 2330 UT 18 February 1994
Summary for 18 February and Forecast up to 21 February
IPS Warning 06 was issued on 17 Feb and is current for
20-23 Feb.

1A. SOLAR SUMMARY
Activity: low

Flares: none.

Observed 10.7 cm flux/Equivalent Sunspot Number : 106/055

1B. SOLAR FORECAST
19 February 20 February 21 February
Activity Low Low Low
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number : 110/060

1C. SOLAR COMMENT
None.

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth : quiet

Estimated Indices : A K Observed A Index 17 February
Learmonth 03 2012 1002
Fredericksburg 07 11
Planetary 07 08

2B. MAGNETIC FORECAST
DATE Ap CONDITIONS
19 Feb 10 Quiet to unsettled.
20 Feb 18 Unsettled to active.
21 Feb 20 Active.

2C. MAGNETIC COMMENT
None.

3A. GLOBAL HF PROPAGATION SUMMARY
LATITUDE BAND
DATE LOW MIDDLE HIGH
18 Feb normal normal normal

PCA Event : None.
3B. GLOBAL HF PROPAGATION FORECAST
LATITUDE BAND
DATE LOW MIDDLE HIGH
19 Feb normal normal fair
20 Feb normal fair poor
21 Feb normal fair poor
3C. GLOBAL HF PROPAGATION COMMENT
NONE.

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
MUFs at Sydney were about 10% above predicted monthly values

T index: 51

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
DATE T-index MUFs
19 Feb 55 About 10% above predicted monthly values.
20 Feb 20 About 10% below predicted monthly values.
21 Feb 10 About 15% below predicted monthly values.

Predicted Monthly T Index for February is 30.

4C. AUSTRALIAN REGION COMMENT
None.

In article <petere-170294132157@engels.mitre.org> petere@mitre.org (Peter D. Engels) writes:

>to civilian users. However, DO NOT PANIC. All the GPS receivers on the
>market, and in the marine stores today, do not use the P-Code. Tey rely
>entirely on the C/A code. This announcement has no practical meaning for
>us civilian GPS users.

Not quite true! It may be true for civilian navigators but it's not true for civilian geodisists and scientists who need access to L2 to correct for the effects of the ionosphere. The C/A-code is not transmitted on L2 -- only the P-code which is now encrypted. This means that clever ways had to be found to get access to L2 all of which result in a lower signal-to-noise ratio (i.e. more noise) on the measurements with the attendant lower accuracy of position measurements.

Amateur Radio Net

```
Amateur Radio Net is a net dedicated to Amateur Radio enthusiasts. If
you are an Amateur Radio enthusiast, or any of your callers are, this is
an echomail network for you. ARnet is replacing an older ham radio
network that recently folded - RF-Net(tm).

If you would like to get more information about this net, please look
for the information packet ARNET024.ZIP on the following BBS's:

Channel1
SaltAir
Mustang HQ BBS
Execnet
Intelec
Sound Of Music
and the Network Host BBS - The Silicon Garden.
It can be FREQ'd from 1:2619/211 using a magic name of ARNET

ARnet is available via QWK & FIDO. As this is the initial announcement
of the net many HUB positions are still open.

If you have any questions, please contact me.

John Woodstock, N2HAA
P.O. Box 436
Coram, NY 11784
BBS: 516-736-6662
FIDO: 1:2619/211

275. Stanford OSCAR talk in Berkeley, CA, USA.

Newsgroup: rec.radio.amateur.space
Date: 1994-02-19 22:39:02 UTC
From: marchant@sdp1.cea.berkeley.edu
Message-ID: <2k64e6$jo4@agate.berkeley.edu>
Source record: 27929

On Thursday, March 3rd, at 7:30 PM, Professor Robert Twiggs of Stanford's newly formed small satellite department will be giving a talk about their amateur radio based satellite program. Professor Twiggs's extensive background in amateur satellites at Weber State University included OSCAR WO-18 and NUSAT I. His positive experience with including OSCAR activities in the education curriculum has led him to establish a program at Stanford. He hopes to get faculty, staff, students and local volunteer engineers to work together in a similar manner as was done at WSU to design, build, launch and operate microsatellites at Stanford. Professor Twiggs will be discussing possible payloads for Stanford's amateur satellites and science payloads for the larger buses that they would like to build.

The talk will be held in downtown Berkeley, CA at UCB's Center for EUV Astrophysics, 2150 Kittredge Street. The CEA is between Shattuck and Oxford Streets, diagonally across from the California Cinema.

A tour of the CEA, including the Science Operations Center for NASA's Extreme Ultraviolet Explorer satellite (EUVE), will be available for those arriving at 7:00 PM.

276. Two-Line Orbital Element Sets (TLE345)

Newsgroup: rec.radio.amateur.space
Date: 1994-02-20 16:36:23 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.761762183@afit.af.mil>
Source record: 27930
Cross-posted to: rec.radio.amateur.space,rec.radio.info

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.info.
This week's elements are provided below.

New HF Packet Radio BBS Carrying AMSAT Info

WT0N-3 St. Paul, Minnesota will carry all AMSAT bulletins and Keps as well as other satellite related items such as "SPACENEWS." The station will be on 10.127 LSB (30M) Monday through Saturday from 16:00 UTC until 23:OO UTC Monday through Saturday. The PBBS uses 300 baud HF Packet, but will also be available for AMT
is 23:30 to 04:00 UTC. At this time, the PBBS is set up as an experiment and any comments and suggestions should be sent to the SYSOP, B.J. Arts (WT0N), at one of the following:

PACKET:WT0N@WB0GDB.#STP.MN.USA.NOAM

Current AMSAT Operations Net Schedule For AO-13

AMSAT Operations Nets are planned for the following times. Mode-B Nets are conducted on AO-13 on a downlink frequency of 145.950 MHz. If, at the start of the OPS Net, the frequency of 145.950 MHz is being used for a QSO, OPS Net enthusiasts are asked to move to the alternate frequency of 145.955 MHz.

Date UTC Mode Phs NCS Alt NCS

28-Feb-94 0430 B 068 WB6LLO W9ODI

Any stations with information on current events would be most welcomed. Also, those interested in discussing technical issues or who have questions about any particular aspect of OSCAR statellite operations, are encouraged to join the OPS Nets. If neither of the Net Control Stations show up, any participant is invited to act as the NCS.

WEEKLY OSCAR STATUS REPORTS

HR AMSAT NEWS SERVICE BULLETIN 050.03 FROM AMSAT HQ
SILVER SPRING, MD FEBUARY 19, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-050.03

Weekly OSCAR Status Reports: 19-FEB-94

AO-13: Current Transponder Operating Schedule:
L QST
Mode-B : MA 0 to MA 90 |
Mode-BS : MA 90 to MA 120 |
Mode-S : MA 120 to MA 145 |<- S transponder; B trsp. is OFF
Mode-S : MA 145 to MA 150 |<- S beacon only
Mode-BS : MA 150 to MA 180 | Blon/Blat 180/0
Mode-B : MA 180 to MA 256 |
Omnis : MA 230 to MA 30 | Move to attitude 240/0, Apr 04
[G3RUH/DB2OS/VK5AGR]

FO-20: The FO-20 command station announced that a slight mulfunctioning in the onboard command system had been detected. So, the analog mode operations arranged from 9th of Feb. will be performed on schedule, but there is a possibility of interruption due to commading. The present schedule is as same announced before.
ANALOG MODE:
23-FEB-94 8:05 -TO- 02-MAR-94 6:40 UTC
09-MAR-94 7:05 -TO- 16-MAR-94 7:30 UTC
23-MAR-94 7:52 -TO- 30-MAR-94 8:15 UTC
DIGITAL MODE: Unless otherwise noted above.
[Kazu Sakamoto (JJ1WTK) qga02014@niftyserve.or.jp]

AO-16: Operating normally. Experimenter's Day with S-Band transmitter on will be run on 02/23/94 03:45 UTC to 02/24/94 03:15 UTC. Whole Orbit Data (WOD) collections each month by week are: 1) Solar Array Currents, 2) Temperatures 3) Power/Bus Voltages 4) Various telemetry parameters to be determined by the Command Team.
[WH6I & WJ9F]

LO-19: Operating normally. [WH6I]

KO-23: Up and running. [WH6I]

KO-25: BBS up and running. [WH6I]

POSAT: Definitely seems to be turned off on the amateur frequencies.
[WH6I]

IO-26: Is back up and running (1200 baud) and seeing a lot of use. [WH6I]

AO-21: LW2DTZ reports that the RUDAK-II beacon was sending the following
information: RUDAK2>BEACON:RUDAK-II Schedule: (down 145.987 MHz,
up 435.016) min/10 Beacon Mode
0..4 FM Repeater
5..7 WEFAX Picture
8..9 AFSK TLM

LW2DTZ further notes that AO-21 is very active with hams from south
of Brazil using this crossband repeater. [LW2DTZ]

MIR: MIR is working normally in 145.550 MHz. R0MIR and R0MIR-1 Personal
Messaging System (PMS) are active on all the orbits. [LW2DTZ]

RS-10: ZS6AOP reports that RS-10 is still operating normally at his QTH.
He notes that there are a handful of regular stations keeping
the contacts going but recently he has experienced a quiet spell,
only hearing himself. ZS6AOP wonders what the preferred mode of
operation is over Europe and the USA? Do any stations use CW? The
only times has heard CW over Southern Africa is for tuning and
spotting one's own signal. [ZS6AOP]

UO-11: ZS6AOP has been monitoring this satellite at regular intervals.
It is his observation that the signals are weaker today than before
the on-board computer "crash" several months ago. [ZS6AOP]

The AMSAT NEWS Service (ANS) is looking for volunteers to contribute weekly
OSCAR status reports. If you have a favorite OSCAR which you work on a
regular basis and would like to contribute to this bulletin, please send
your observations to WD0HHU at his CompuServe address of 70524,2272, on
INTERNET at wd0hhu@amsat.org, or to his local packet BBS in the Denver, CO
area, WD0HHU @ W0LJF.#NECO.CO.USA.NOAM. Also, if you find that the current
set of orbital elements are not generating the correct AOS/LOS times at
your QTH, PLEASE INCLUDE THAT INFORMATION AS WELL. The information you
provide will be of value to all OSCAR enthusiasts.

IPS RADIO AND SPACE SERVICES AUSTRALIA
Daily Solar And Geophysical Report
Issued at 2330 UT 19 February 1994
Summary for 19 February and Forecast up to 22 February
IPS Warning 06 was issued on 17 Feb and is still current.

1A. SOLAR SUMMARY
Activity: very low

Flares: none.

Observed 10.7 cm flux/Equivalent Sunspot Number : 108/058

1B. SOLAR FORECAST
20 February 21 February 22 February
Activity Low Low Low
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number : 110/060

1C. SOLAR COMMENT
None.

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth : unsettled

Estimated Indices : A K Observed A Index 18 February
Learmonth 12 2232 3243
Fredericksburg 16 07
Planetary 18 07

2B. MAGNETIC FORECAST
DATE Ap CONDITIONS
20 Feb 16 Unsettled to active.
21 Feb 18 Unsettled to active.
22 Feb 16 Unsettled to active.

2C. MAGNETIC COMMENT
None.

3A. GLOBAL HF PROPAGATION SUMMARY
LATITUDE BAND
DATE LOW MIDDLE HIGH
19 Feb normal normal fair-normal
PCA Event : None.

3B. GLOBAL HF PROPAGATION FORECAST
LATITUDE BAND
DATE LOW MIDDLE HIGH
20 Feb normal fair poor
21 Feb normal fair poor
22 Feb normal fair poor
3C. GLOBAL HF PROPAGATION COMMENT
NONE.

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
MUFs at Sydney were 15 to 30% above predicted monthly values

T index: 81

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
DATE T-index MUFs
20 Feb 20 About 10% below predicted monthly values.
21 Feb 30 Near predicted monthly values.
22 Feb 35 Near predicted monthly values.

Predicted Monthly T Index for February is 30.

4C. AUSTRALIAN REGION COMMENT
None.

279. Daily IPS Report - 21 Feb 94

Newsgroup: rec.radio.amateur.space
Date: 1994-02-21 06:19:59 UTC
From: dave@eram.esi.com.au
Message-ID: <5201@eram.esi.com.au>
Source record: 27933
Cross-posted to: aus.radio,rec.radio.amateur.space,rec.radio.info

IPS RADIO AND SPACE SERVICES AUSTRALIA
Daily Solar And Geophysical Report
Issued at 2330 UT 20 February 1994
Summary for 20 February and Forecast up to 23 February
IPS Warning 06 was issued on 17 Feb and is current for
interval 20-23 Feb.

1A. SOLAR SUMMARY
Activity: moderate

Flares Max Fadeout Begin End Freq. Sectors
M4/3B 0141UT Confirmed 0116UT - Lower West Pacific

Observed 10.7 cm flux/Equivalent Sunspot Number : 108/058

1B. SOLAR FORECAST
21 February 22 February 23 February
Activity Low Low Low
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number : 110/060

1C. SOLAR COMMENT
A proton event began at 20/0300UT in association with the M4 flare.
A large solar filament located near this region has
dissappeared. Flaring region has simplified and is not expected to
produce further flares.

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth : mainly quiet to unsettled.

Estimated Indices : A K Observed A Index 19 February
Learmonth 12 4232 2331
Fredericksburg 16 23
Planetary 16 17

2B. MAGNETIC FORECAST
DATE Ap CONDITIONS
21 Feb 20 Active.
22 Feb 30 Active to minor storm.
23 Feb 30 Active to minor storm.

2C. MAGNETIC COMMENT
A shock is expected in the field from the M4 flare at approx.

21/2000 UT. Further activity is expected from filament dissappearance
on the 23rd. Recurrent activity (coronal hole) also expected
Feb 22-24. Minor storm periods are expected during local night.

3A. GLOBAL HF PROPAGATION SUMMARY
LATITUDE BAND
DATE LOW MIDDLE HIGH
20 Feb normal normal poor-normal
PCA Event : Began at 0300UT, peaked at 0915UT (74PFU), in progress.
3B. GLOBAL HF PROPAGATION FORECAST
LATITUDE BAND
DATE LOW MIDDLE HIGH
21 Feb normal fair poor
22 Feb fair poor poor
23 Feb fair poor poor
3C. GLOBAL HF PROPAGATION COMMENT
High lat comms effected by proton event after 0300 UT on 20th. Event
declining. Further poor conditions expected for high lats over next
four days.

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
MUFs at Sydney were near predicted monthly values until this morning
when enhancements of up to 20% were observed.

T index: 51

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
DATE T-index MUFs
21 Feb 60 Near predicted monthly values.
22 Feb 30 10 to 20% below predicted monthly values.
23 Feb 30 10 to 20% below predicted monthly values.

Predicted Monthly T Index for February is 30.

4C. AUSTRALIAN REGION COMMENT
Degraded and depressed HF conditions are expected over the next
four days due to recurrent/flare and dissappearing filament
activity.

280. APT-Satellites: Report FEB 19, 1994

Newsgroup: rec.radio.amateur.space
Date: 1994-02-21 08:29:10 UTC
From: peter.henne@gmd.de
Message-ID: <1994Feb21.082910.10193@gmd.de>
Source record: 27934
Cross-posted to: rec.radio.amateur.space,rec.radio.info

```
Observed at station 50.7 NLat, 7.1 ELon, FEB 19, 1994

NOAA-9: APT 137.62 On
NOAA-10: APT 137.50 On
NOAA-11: APT 137.62 On
NOAA-12: APT 137.50 On
Meteor 2-21: APT 137.85 On (weak)

NOAA-9 performs well after the outgassing-period, transmitting
Ch.2 and Ch.4 during spacecraft-day and Ch.3 and Ch.4 during
spacecraft-night. The morning descending orbits pass over better
illuminated areas than afternoond-ascening NOAA-11. APT and BCN
of NOAA-9 will be switched off FEB 21 due to VHF-conflict with
NOAA-11 (info from wxsat-list).
Meteor 2-21 is more or less useless for normal APT-Stations.
Meteor 3-3, -4, -5 and -6 were off during all visible passes,
a message about active Meteor 3-6 APT could not be confirmed.

282. Daily IPS Report - 22 Feb 94

Newsgroup: rec.radio.amateur.space
Date: 1994-02-22 02:47:30 UTC
From: dave@eram.esi.com.au
Message-ID: <5204@eram.esi.com.au>
Source record: 27936
Cross-posted to: aus.radio,rec.radio.amateur.space,rec.radio.info

IPS RADIO AND SPACE SERVICES AUSTRALIA
Daily Solar And Geophysical Report
Issued at 2330 UT 21 February 1994
Summary for 21 February and Forecast up to 24 February
IPS Warning 06 was issued on 17 Feb and is current for
interval 20-23 Feb.

1A. SOLAR SUMMARY
Activity: very low

Flares: none.

Observed 10.7 cm flux/Equivalent Sunspot Number : 105/054

1B. SOLAR FORECAST
22 February 23 February 24 February
Activity Low Low Low
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number : 105/054

1C. SOLAR COMMENT
None.

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth : major storm

Estimated Indices : A K Observed A Index 20 February
Learmonth 45 2126 6664
Fredericksburg 54 13
Planetary 60 13

2B. MAGNETIC FORECAST
DATE Ap CONDITIONS
22 Feb 50 Minor storm.
23 Feb 35 Active to minor storm.
24 Feb 20 Active to minor storm.

2C. MAGNETIC COMMENT
Shock in field was observed at 0900Z 135nT. Major storm levels
observed after shock. Shock due to M4 flare.

3A. GLOBAL HF PROPAGATION SUMMARY
LATITUDE BAND
DATE LOW MIDDLE HIGH

21 Feb fair-normal fair-normal poor-fair
PCA Event : In progress.
3B. GLOBAL HF PROPAGATION FORECAST
LATITUDE BAND
DATE LOW MIDDLE HIGH
22 Feb poor poor poor
23 Feb fair poor poor
24 Feb normal fair poor
3C. GLOBAL HF PROPAGATION COMMENT
Continuing geomagnetic activity is degrading global HF propagation
conditions. PCA event has degraded high lat HF comms.

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
MUFs at Sydney were 10-20% enhanced until dawn then depressed 10-20%

T index: 64

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
DATE T-index MUFs
22 Feb 0 About 20% below predicted monthly values.
23 Feb 15 About 15% below predicted monthly values.
24 Feb 20 About 15% below predicted monthly values.

Predicted Monthly T Index for February is 30.

4C. AUSTRALIAN REGION COMMENT
Degraded and depressed HF conditions are expected over the next
three days due to recurrent/flare and dissappearing filament
activity.

283. Satellite progs on World

Newsgroup: rec.radio.amateur.space
Date: 1994-02-22 04:14:06 UTC
From: wy1z@netcom.com
Message-ID: <wy1zCLLyFJ.IpF@netcom.com>
Source record: 27937
Cross-posted to: rec.radio.amateur.space,rec.radio.amateur.misc

I have now placed some satellite tracking programs on World:

- stsplus.zip

- stsorbit.zip

- traksat {trak300a.zip & trak300b.zip} (latest version of traksat)

They are available via anonymous FTP via

ftp ftp.std.com:/pub/hamradio/pc/satellite

If you have any problems, questions, or comments, please e-mail them to me.

I tried very hard to search for stsplus through many archie searches, and
only found one site which carried it. I hope that by making it available
on World it will be easier to obtain.

73,
Scott, WY1Z

284. Anyone copy DOVE telemetry last week?

Newsgroup: rec.radio.amateur.space
Date: 1994-02-22 16:16:59 UTC
From: genewill@efn.org
Message-ID: <CLMvwC.8u8@efn.org>
Source record: 27938

My 2meter TNC was QRT for a little over a week, so I missed some of the DOVE telemetry. Am looking for the callsigns of those hams having reported hearing DOVE. The last calls I copied were 8th Feb 1994 DOVE reports have been received from : CT1FAK DC1RT DG5AOF DH5DAH DJ5XO EA1BCU EA2ABF EA2BFF EB8AUB F11AFX F11BYB G2UK Then I pick up again with:
19th Feb 1994 DOVE reports have
been received from : KB4CYC KB5YVF KB7QLY KC1WD KC2SF KC3H KC4ZRH KC6ROL KB2BD KD4GAR KD4GHQ KD4SHL KD4UPF KD6NEW KI0G KM6JV KMA1JL KR5J KX7L LA5VX

Can anyone help with the calls between G2UK and KB4CYC? (Yes, I know this is cheating . . . I should be copying from DOVE.) TIA!
73 . . . . ._ Gene K7DBV

285. MIR QSLs

Have you made successful contact with the Mir Space Station and
U9MIR (Viktor)?

I'm hunting for the QSL address and information for U9MIR. I am
particularly interested in responses from anyone who has
successfully obtained a card.

Please reply to ead@arrl.org. Thank you!

Sincerely and 73,

286. Satelite operating list?

Newsgroup: rec.radio.amateur.space
Date: 1994-02-23 20:49:00 UTC
From: stephen@hpdmlge.boi.hp.com
Message-ID: <CLp35p.EL9@boi.hp.com>
Source record: 27940

I would like to get into working satelites and I was wondering if there was a list of all the amateur satelites with frequencies, modes and schedules for use. I have listened to RS-10/11 and RS-12/13 on several passes and I am very excited about this aspect of the hobby. Does anyone have a "favorite" satelite? Is there a special set of rules for working satelites? Is all of this in a FAQ somewhere?

Thanks for your patience.

292. RDSS and CDMA

Newsgroup: rec.radio.amateur.space
Date: 1994-02-25 14:41:11 UTC
From: bergst@birch.ee.vt.edu
Message-ID: <2kl2m7$54o@solaris.cc.vt.edu>
Source record: 27958

As part of a course I'm taking, we are studying a dedicated RDSS satellite system which provides RDSS services and two-way messaging. Being a controls student, some of the satellite communcations issues are unfamiliar to me. Would you please answer the following questions?

The original system proposed to have 3 satellites each with 8 beam antennas to cover the continental US (CONUS?). The transmission method is to be CDMA. Now, the system is to use 4 single beam satellites to replace two of the 8 beam satellites.

It has been said that this configuration will reduce the number of RDSS systems which can occupy the allocated bandwidth. Why? (a 70% reduction according my information)

The smaller satellites will have have smaller operating powers. This is said to reduce the number of simutaneous users of the CDMA system. Again...why?

Thank you in advance for any help you provide,

Robert Bergstrom

P.S. The course is on financing and operation technology companies. Unfortunately, being a non-engineering course, the technical arguements are a bit sketchy, and I'm out of my element.

293. Whereabouts of Instant Track "B" Patch

Newsgroup: rec.radio.amateur.space
Date: 1994-02-25 16:37:00 UTC
From: dg651@cleveland.Freenet.Edu
Message-ID: <2kl9fc$hob@usenet.INS.CWRU.Edu>
Source record: 27946

The following paragraph discussing the "B" patch for the InstantTrac program was found a the archive.afit.af.mil site. The patch is not in the pub/space directory but is available via the Celestial BBS (TS Kelso, SYSOP).

>[1] ITPATCH2.ZIP 9111 5-May-1992 01:53
> Patch #2 to InstantTrack 1.00. This program updates InstantTrac
> or 1.00a to version 1.00b. This patch is mandatory for anybody
> installed Patch #1, because it corrects a slightly dangerous bug
> Patch #1. Like Patch #1, this patch solves the problem of different
> NASA Keplerian elements file formats by permitting either format
> read in by InstantTrack.

Is there an ftp site with InstantTrac 1.00b version/patch?

Thanks for any leads.

* HF PBBS UPDATE *
==================
The WT0N-3 HF Packet Radio BBS in St. Paul, MN on 10.127 MHz now also supports PACTOR communications under the callsign of WT0N. The BBS is available for packet operations Monday through Saturday from 1600 UTC until 2300 UTC. PACTOR operations are currently scheduled during the hours of 23:30 UTC and 04:00 UTC. The system carries all AMSAT bulletins and Keplerian data for OSCAR satellites. It also carries other satellite related items such as "SpaceNews".

The BBS is currently set up as an experiment. Comments and suggestions should be directed to the sysop, BJ Arts at any one of the following addresses:

Packet: WT0N@WB0GDB.#STP.MN.USA.NOAM
Internet: BJARTS@STTHOMAS.EDU
HF PACKET: WT0N-3 (ON 30 MET
HF PACTOR: WT0N

* RS-15 NEWS *
==============
According to reliable sources close to the project, a launch date for RS-15 has still not been firmed up, and the official presentation before the Russian Space Agency has been delayed until 20-Mar-94.

The following is some data pertaining to the transponder carried on RS-15 and its orbital charateristics:

uplink: 145.857 - 145.897 MHz
downlink: 29.351 - 29.397 MHz
beacon 29.398 MHz.....P = 0.4/1.2 W
beacon 29.353 MHz.....P = 0.4/1.2 W
antenna.....1/4 wavelength
height.....2,300 km
inclination.....67 degrees

[Info via Gustavo, LW2DTZ]

* OSCAR TALK AT BERKELEY *
==========================
On Thursday, March 3rd, at 7:30 PM, Professor Robert Twiggs of Stanford's newly formed small satellite department will be giving a talk about their amateur radio based satellite program. Professor Twiggs's extensive background in amateur satellites at Weber State University included OSCAR WO-18 and NUSAT I. His positive experience with including OSCAR activities in the education curriculum has led him to establish a program at Stanford. He hopes to get faculty, staff, students and local volunteer engineers to work together in a similar manner as was done at WSU to design, build, launch and operate microsatellites at Stanford. Professor Twiggs will be discussing possible payloads for Stanford's amateur satellites and science payloads for the larger buses that they would like to build.

The talk will be held in downtown Berkeley, CA at UCB's Center for EUV Astrophysics, 2150 Kittredge Street. The CEA is between Shattuck and Oxford Streets, diagonally across from the California Cinema.

A tour of the CEA, including the Science Operations Center for NASA's Extreme Ultraviolet Explorer satellite (EUVE), will be available for those arriving at 7:00 PM.

Will Marchant Center for Extreme Ultraviolet Astrophysics
marchant@cea.berkeley.edu University of California
KC6ROL@N0ARY 2150 Kittredge St., Berkeley, CA 94720 USA

* FO-20 SCHEDULE *
==========
The FO-20 command station announced that a slight malfunction in the onboard command system had been detected. As a result, analog mode operation arranged from 09-Feb-94 will be performed on schedule, but there is a possibility of interruption due to satellite ground station control.

The present schedule is as announced before:

Analog mode:
09-Feb-94 07:15 -to- 16-Feb-94 07:40 UTC
23-Feb-94 08:05 -to- 02-Mar-94 06:40 UTC
09-Mar-94 07:05 -to- 16-Mar-94 07:30 UTC
23-Mar-94 07:52 -to- 30-Mar-94 08:15 UTC

Digital mode: Unless otherwise noted above.

[Info via Kazu Sakamoto, JJ1WTK]

* SpaceNews VIA SAT
==========
SpaceNews distribution via the Amateur Packet Radio Network has been improved recently with the help of high-speed "Pacsat" satellites. These polar orbiting satellites now make SpaceNews available to every inch of the planet several times daily at 9600 bps. My sincere thanks to W3QNS for uploading copies of SpaceNews to the KIT
them available for all KO-23 satellite users.

* CONGRATULATIONS! *
==========
Congratulations to Jeff Ward, G0/K8KA, who recently earned his Doctorate degree. Jeff has been instrumental in the design of not only OSCAR satellite hardware, but also the ground station software that is used for Pacsat communications. His work has had a great impact on emerging microsatellite and digital communications technology, and we all look forward to working with him in future satellite projects and in expanding the communications resources available to Amateur Radio operators worldwide.

* THANKS! *
==========
Thanks to all those who sent QSL cards, letters, and messages of appreciation regarding SpaceNews, especially:

297. Two-Line Orbital Element Set Format

Newsgroup: rec.radio.amateur.space
Date: 1994-02-26 22:45:17 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.762302717@afit.af.mil>
Source record: 27950
Cross-posted to: rec.radio.amateur.space,rec.radio.info

As a service to the satellite user community, the following description of the NORAD two-line orbital element set format is uploaded to sci.space.news and rec.radio.info on a monthly basis. The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity. In addition, element sets (also updated daily) and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 0 is a eleven-character name.

Lines 1 and 2 are the standard Two-Line Orbital Element Set Format identical to that used by NORAD and NASA. The format description is:

```
Line 1
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BST
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods, plus signs = 0; minus signs = 1)
```

Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6
1 11416U 86 50.28438588 0.00000140 67960-4 0 5293
2 11416 98.5105 69.3305 0012788 63.2828 296.9658 14.24899292346978

Hi!
I'm developing an Emergency Beacon for Positioning and Rescue of ship and aircraft use, and I need some information about the COSPAS/SARSAT satellite system.

Basically, I want to know what information must be sent, how it has to be encoded on each of the three frequencies (121.5 MHz, 243 MHz and 406 MHz).

If you have ANY of this information (or part of it), please send it to me (or at least let me know) via the following paths:

Packet radio: lu7akc @ lu7akc.#col.cf.arg.soam
Internet: postmaster@asarin.org.ar

Thankyou in advance!

73's de Ed Sweet.

301. [Q] amateur satellite performance record

Newsgroup: rec.radio.amateur.space
Date: 1994-02-27 16:24:29 UTC
From: wsears@lpl.arizona.edu
Message-ID: <WSEARS.94Feb27092430@eludium.lpl.arizona.edu>
Source record: 27954

Greetings,

I'm interested in up-to-date preformace records for the amateur satellites.
What I mean by that is things like:
How many launched vs. how many still in service.
How many launched vs. how many survived passed their designed life,
and what failure modes have been experienced.

The idea here is to be able to show people how well the amateur satellite
service has done, and enforce the arguments for small space craft in
the space science community. Any help would be welcome.

PRELIMINARY RS-15 INFORMATION

HR AMSAT NEWS SERVICE BULLETIN 057.01 FROM AMSAT HQ
SILVER SPRING, MD FEBUARY 26, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-057.01

Preliminary RS-15 Data Provided by LW2DTZ

Gustavo Carpignano (LW2DTZ) provides this summary of information regarding RS-15 which he has obtained from several Russians who are participating in this project.

According to these sources, the official "presentation" of RS-15 to the Russian Space Agency has been delayed until 20-MAR-94. The launch date has shifted its position for launch since the Cosmodrome is not quite ready for it. It is reported that RS-15 will launched by a Rokot vehicle, which is a refurbished SS-19 with the addition of a third stage.

Some data regarding equipment and orbital parameters are:

Uplink: 145.857 - 145.897 MHz
Downlink: 29.351 - 29.397 MHz
Beacon #1 29.398 MHz Power 0.4 or 1.2 W
Beacon #2 29.353 MHz Power same as Beacon #1
Antenna 1/4 wave
Height 2,300 KM
Inclination 67 degrees

Much of this information has also been confirmed by Vern Riportella (WA2LQQ) by his sources in Russia.

[The AMSAT News Service (ANS) wishes to thank Gustavo Carpignano (LW2DTZ) of AMSAT-LU and Vern Riportella (WA2LQQ) for the information used in preparing this bulletin.]

G0/K8KA Receives Doctorial Degree From University of Surrey

It is with very great pleasure that the amateur space community congratulates Jeff Ward (K8KA/G0SUL) on the award of his PhD thesis after a "viva voce" examination Thursday, 24-FEB-94 at the University of Surrey in England. Dr. Martin Sweeting (G3YJO) announced that Jeff's thesis, entitled "The Design, Implementation and In-Orbit Demonstration of a Store & Forward Digital Communication System for Low Earth Orbit Satellites", was accepted by the University of Surrey Examiners unanimously without need for any corrections. G3YJO notes that such unconditional acceptance is a rare occurrence.

The amateur space community joins G3YJO in saying, "Well done Dr. Ward"!

Bill Tynan W3XO, AMSAT-NA President says that he is especially pleased with Jeff's accomplishment because they represent yet another example of the role that amateur radio can play in education at all levels.

[The AMSAT News Service (ANS) would like to thank Martin Sweeting (G3YJO) for the information used in this bulletin.]

BREMSAT TELEMETRY REPORTS NEEDED

HR AMSAT NEWS SERVICE BULLETIN 057.03 FROM AMSAT HQ
SILVER SPRING, MD FEBUARY 26, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-057.03

BREMSAT Telemetry Reports Requestedle For AO-13

The German BREMSAT satellite was deployed on the STS-60 shuttle mission in early February as a "getaway special." It is a scientific satellite carrying a number of experiments including measurements of atomic oxygen, micrometeor/dust impacts, etc. BREMSAT is in a low orbit and is predicted to enjoy a lifespan of only 45 days.

Oliver Amend (DG6BCE) has asked radio amateurs for assistance in monitoring BREMSAT's telemetry during reentry. Oliver is a member of the German "Technical Youth Leisure Education Association." They hope to compile the reentry telemetry from several groundstations located along the reentry path. However, the path is difficult to predict and he is looking for amateurs -- particularly those in the southern hemisphere -- who can act as monitoring stations to fill any gaps in their coverage.

BREMSAT transmits 9600 bps telemetry on 137.8 MHz. The data can be received with a simple bi-phase decoder. Construction details are available directly from DG6BCE.

If you are interested in monitoring the final moments of BREMSAT, or if you know anyone who is, please contact Oliver Amend at the following address:

Oliver Amend
Durerstr. 56
D-28844 Weyhe-Leeste
Germany

At this late date, it may be best to send a fax message to him if you have the capability. Address the fax cover sheet to:

AO-13 OPERATIONS NET

HR AMSAT NEWS SERVICE BULLETIN 057.04 FROM AMSAT HQ
SILVER SPRING, MD FEBUARY 26, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-057.04

Current AMSAT Operations Net Schedule For AO-13

AMSAT Operations Nets are planned for the following times. Mode-B Nets are conducted on AO-13 on a downlink frequency of 145.950 MHz. If, at the start of the OPS Net, the frequency of 145.950 MHz is being used for a QSO, OPS Net enthusiasts are asked to move to the alternate frequency of 145.955 MHz.

Date UTC Mode Phs NCS Alt NCS

05-Mar-94 2200 B 077 W9ODI VE2LVC
13-Mar-94 0130 B 075 VE2LVC W9ODI
19-Mar-94 1730 B 073 W5IU WA5ZIB
26-Mar-94 2130 B 084 WA5ZIB W5IU

Any stations with information on current events would be most welcomed. Also, those interested in discussing technical issues or who have questions about any particular aspect of OSCAR statellite operations, are encouraged to join the OPS Nets. If neither of the Net Control Stations show up, any participant is invited to act as the NCS.

AO-13 ZRO Tests For March 1994

The following schedule of Mode "B" tests were chosen for convenient operating times and favorable squint angles. The tests can be heard on 145.840 MHz. Andy McAlister (WA5ZIB) will conduct all the tests. Mode "JL" tests will no longer occur due to the failure of AO-13's 70CM transmitter.

Day Date (UTC) Time Areas covered

Saturday Mar. 19, 1994 1930 UTC NA, SA, Europe, Africa
Saturday Mar. 26, 1994 2315 UTC NA, SA

Note that the dates and days are shown in "UTC". Any changes will be announced as soon as possible via the AMSAT HF and AO-13 Operations Nets.

All listener reports with date of test and numbers copied should be sent to Andy MacAllister (WA5ZIB), AMSAT V.P. User Operations, 14714 Knights Way

Drive, Houston, TX 77083-5640. A report will be returned verifying the
level of accurate reception. An S.A.S.E. is appreciated but not required.

23-MAR-94 7:52 -TO- 30-MAR-94 8:15 UTC
DIGITAL MODE: Unless otherwise noted above.
[Kazu Sakamoto (JJ1WTK) qga02014@niftyserve.or.jp]

AO-16: Operating normally. [WH6I]

LO-19: Operating normally. [WH6I]

IO-26: The BBS is up and running (1200 baud) and seeing a lot of use.
[WH6I]

KO-23: Up and running. [WH6I]

KO-25: The BBS is running. After the first "bunch" of images, there have
been no new ones. The format for the smaller image files will
apparently not be made available to amateurs. [WH6I]

RS-12: Last week ZS6AOP asked what the preferred mode of operation is over
Europe and the US? AL7MK reports that while he lived in Alaska,
about 75% of his QSOs on RS-12 were accomplished using CW because,
as he explains, "it worked better on marginal passes." Today AL7MK
lives in CT. His satellite operations only include MIR using his
H/T with a 30 watt amplifier at the moment until he brings his HF
gear out of storage. [AL7MK @ W1NRG.CT]

The AMSAT NEWS Service (ANS) is looking for volunteers to contribute weekly OSCAR status reports. If you have a favorite OSCAR which you work on a regular basis and would like to contribute to this bulletin, please send your observations to WD0HHU at his CompuServe address of 70524,2272, on INTERNET at wd0hhu@amsat.org, or to his local packet BBS in the Denver, CO area, WD0HHU @ W0LJF.#NECO.CO.USA.NOAM. Also, if you find that the current set of orbital elements are not generating the correct AOS/LOS times at your QTH, PLEASE INCLUDE THAT INFORMATION AS WELL. The information you provide will be of value to all OSCAR enthusiasts.

303. Portable Oscar 13 Station?

Newsgroup: rec.radio.amateur.space
Date: 1994-02-27 21:25:56 UTC
From: zlau@arrl.org
Message-ID: <1994Feb27.212556.8284@arrl.org>
Source record: 27956

I've not been able to find much on portable Oscar 13
stations--ones that work well with little antennas
and low power. The QRP publications seem to focus
on the low earth orbit satellites.

I tried Mode S, 6 watts to a 5.5 ft boom 436 MHz
yagi and a 2 ft. dish with a 2.4 GHz feed, but
only made 6 contacts in 3 hours (1 hr/day).

Problem was, several stations had trouble hearing
my signal, even though it sounded fine to me.
I could sometimes hear myself clearly running
6 dB less power (1.5 watts).

Should I try Mode B or work on my 436 antenna?

I prefer small antennas I can stick in my car
without taking apart. Makes a big difference
when the weather changes for the worse....

Source record: 27957

Hello netters,
I'm looking for information/schematics on how to make a GPS reciever.
It must be fairly simple to make and cost around $10.00 to build. :-)
Seriously though, I'd like it to be resonable in price. I want to build
one to use for making maps for orienteering and also to track myself
on excursions into the deep woods. There is nothing I can't handle
in the digital world but the world of high frequency analog is kind
of a mystery. Any help would be greatly appreciated.

Hey, that's good. The problem's not on your end. The
problem is that most mode S stations are deaf, most
mode B too if the truth be known.

>Should I try Mode B or work on my 436 antenna?
>
>I prefer small antennas I can stick in my car
>without taking apart. Makes a big difference
>when the weather changes for the worse....

The sad fact is that most Oscar users will have
trouble copying you if your signal is much weaker
than the beacon. If you can muster about 100 watts
ERP uplink on 436, a lot more stations will respond
to you. Also there's a lot more activity on mode B,
and some of those stations have impressive receiving
setups (ZRO 8 or better) and will have little trouble
copying your low power uplink.

I had a nice long SSB chat with a group uplinking to
Oscar 10 from Antarctia who were using only 5 watts
and a short beam. (This was before AO10 went sour.)
They'd been calling for days with no response. After I
built a pileup for them, they made a bunch of contacts.
Of course I was using four stacked 424B Long Boomers
with a good mast mounted preamp at the time and they
came booming in on my receiver. Most other stations
had been tuning right past them without noticing they
were there.

When I operate portable, I use a short helix for uplink,
and a 100 watt Mirage amp. I can make enough uplink power
to be heard clearly by most stations, and can turn down
the wick with the better stations. The problem on mode
B is receiving with a small antenna. It limits you to

working only the stronger stations. Your mode S receive
setup sounds really hot. I can't claim that kind of
performance, and I have a 4 foot dish at the home
station. (I obviously need a better LNA.)

307. Re: GPS information

Newsgroup: rec.radio.amateur.space
Date: 1994-02-28 20:18:08 UTC
From: beale@leland.Stanford.EDU
Message-ID: <2ktji0$p8m@nntp2.Stanford.EDU>
Source record: 28061

Keith: (sorry, email to you bounced)

Concerning GPS: not what you want to hear perhaps, but I suspect that a nearly-finished GPS receiver module is the cheapest way to go. Now that the radio front-end has been pretty highly-integrated by high volume manufacturers, do-it yourself GHz spread-spectrum recievers don't make so much sense.

Do you get QEX (the ARRL Experimenter's Exchange, available from ARRL) ? If not, you probably should! The February 1994 issue has: "Interfacing GPS or LORAN Devices to Packet Radio" on p. 9-14. They discuss the Magellan OEM 5000 board (12V at 250 mA, 3.5x7 inch circuit board) which gives you RS-232 output of LAT/LON, altitude, and time in a standard (NMEA) format. It was $445 and needs an external antenna ($60 passive, $130 active). They say that Magellan will be coming out with a smaller GPS card for $295 in May, with binary output rather than formatted ASCII.

Trimble Navigation (Sunnyvale, CA) also makes some OEM GPS modules, although I am only aware of packaged units for use in cars/trucks, and I haven't checked on the pricing.

I believe that a GPS reciever is a challenging project even for an expert in both microwave and digital circuits, with access to a lot of test equipment and a rather large supply of free time.
If your time is even differentially more valuable than exactly zero, I think buying is the way to go!

Best,
John Beale

Keith,

My E-mail bounced as well. E-mail or post a good address if
you want a long message covering where to look for handheld units
whose prices I don't think that you can beat with straight home brew.
They are probably more expensive than you could get away with using
the boards that John suggests, but as finished rugged units including
display, antenna, batteries and charger, they may still have apeal.

The other thing covered that makes the message longer than I
want to post is a copy of an old reply to another poster in which I
try to remember enough about how GPS works in detail, with the object
of convincing the reader that there are better home brew projects upon
which to spend one's time. It could serve to try to convince you that
waiting for the $295 Magellan board is the way to go.

Bill Freeman, KE1G, waf@zk3.dec.com

309. Satellite FAQ answers (long)

Newsgroup: rec.radio.amateur.space

The following text was compiled from the following sources:

* "How to use the EZSATS pas tables by N9LTD" reprinted without permission. Full text, tables, and lots of other useful information can be obtained by sending a SASE to David Mullenix N9LTD, 2052 Brentwood Pky, Madison, WI 53704

* "Amateur Radio Satellite Frequencies" This file can be obtained from the ARRL e-mail server. For information on the server, send an e-mail message to info-serv@arrl.org with 'HELP' in body of message.

* "Summary - Getting onto the Hamsats" This was an article posted to rec.radio.amateur.misc newsgroup by Stephan Greene (sgreene@access.digex.com) on 20 Mar 1992. The article is also available via anon ftp from ftp.cs.buffalo.edu or Australian mirror at grivel.une.edu.au as file pub/hamradio/ham_sat_sum.

* "An Amatuer Satellite Operation Upgrade Path" from the AMSAT Journal, September/October 1993, pp. 24-26.

FORWARD:

Having recently started to get into Satellites, I asked MANY people what it took to get started and what to do. I found few people who could offer all the information necessary to start. I have attempted to compile this information for future newbies. If I have missed something, please ask and I will attempt to add it to the collection.

Also, if you really want to get serious about satellites, I would STRONGLY recommend joining AMSAT to help promote the satellite hobby. AMSAT is a volunteer organization that works for the interests of amateur satellites. Dues are only US$30 per year and you will receive a subscription to "The AMSAT Journal". For US$80, you will receive first year dues and a copy of Instant Track computer tracking software which is a top-notch program. Instant Track was donated to AMSAT by its author and its sales account for a considerable portion of AMSAT's income. AMSAT-NA, 850 Sligo Avenue, Silver Spring, MD 20910-4703. (301) 589-6062. Credit cards welcome. NOTE: I am in no way connected with AMSAT-NA, other than I have found their publications quite useful.

MODES:

The combination of uplink freq, downlink freq, and transmission mode are all lumped together into standardized satellite MODES. Here is a list of common satellite modes used by satellites covered by this article:

A - This mode requires a 2 meter SSB/CW trasmitter and a 10 meter SSB/CW receiver and supports CW and voice.

B - This mode requires a 70 cm SSB/CW transmitter and a 2 meter SSB/CW receiver and supports CW and voice. Some satellites also support RTTY and SSTV in this mode.

K - This mode requires a 15 meter SSB/CW transmitter and a 10 meter SSB/CW receiver and supports CW and voice. This mode is unique in that it can be done with a simple HF rig.

JA- This mode stands for J Analog and requires a 2 meter SSB/CW transmitter and a 70 cm SSB/CW receiver and supports CW, voice.

JD- This mode stands for J Digital and requires a 2 meter FM transmitter and and a 70 cm SSB/CW receiver and supports packet.

S - This mode requires a 70 cm SSB/CW transmitter and a 2.4 GHz SSB/CW receiver and supports CW and voice. Many people use a 2.4 GHz to 2 meter converter with a 2 meter SSB/CW receiver instead of buying a 2.4 GHz SSB/CW receiver.

Also, satellites have 3 basic types of retransmissions: beacon, transponder, and repeater.

Beacon - Most satellites have a fixed Morse beacon at the lower end of the satellites band-pass transponder. This is useful to detect when the satellite has crossed the horizon and is in range for operation. It can also be used to determine dopler shifts.

Transponder - A transponder is a band-pass repeater. It accepts a range of frequencies on the input and retransmits the entire range on the output. All offsets withing that range are preserved. NOTE: since the satellite is transmitting many signals at the same time, it is dividing its output power amongst all of these signals. If someone transmits a very powerful signal into the satellite, it will spend most of its power retransmitting that signal and all of the other signals will drop in power. This is NOT a way to earn friends and people who overpower the satellites input are called "alligators" and are not very popular.

Repeater - This closely resembles a land-based repeater. It listens for signals on one frequency and retransmits it on another frequency. All satellite repeaters (and transponders) are full duplex, meaning you can (and should) listen to you signal on the downlink (with headphones) while you are transmitting.

SATELLITES:

Some satellites are easier to work than others. The satellites that follow can be operated fairly easily and are referred to by some as the Easy Sats. What follows is a breif description of each satellite. A summary list of operating frequencies is included later.

Mir

Mir (promounced "mere" - "Peace" in Russian) is the Russian Space Station. It's been in orbit since 1986. All recent Russian Cosmonauts have been hams and have callsigns with "MIR" in them, such as U2MIR. Mir has 2-meter

equipment on board and they operate packet and voice on 145.55 MHz. (This is the same freq as the Space Shuttles.) The cosmonauts also have a digital voice recorder which can repeatedly transmit voice announcements.

The best way to get a QSL card from Mir is to connect to their TNC's mailbox, R0MIR-2, (That's R Zero MIR) leave a message AND GET A MESSAGE NUMBER. You must have the message number to qualify for a QSL. The TNC is often busy because amatuers forget to disconnect before Mir goes under their horizon. In a case like this, try connecting to yourself or a friend VIA R0MIR. And if you hear a heavily accented voice calling CQ, by all means say hello!

70 cm and ATV gear is being prepared for future flights!

QSL Address:
Sergei Samburov (RV3DR)
Prospect Kosmonavtov. d.36, kw.96
Kaliningrad City, MOSCOW 141070, RUSSIA.

Sergei can also be reached via packet radio as RV3DR @ RK3KP.#MSK.RUS.EU

A special note on caculating Mir's orbit: Mir is big and it's in a low orbit. This means that there's a lot of atmospheric drag and it has to fire its rockets every month or two to boost itself back up or it would have re-entered and burned up long ago. Unfortunately, whenever this happens, it throws off all pass predictions. When this happens, Mir will arrive LATER than predicted, so if you tune to 145.55 and nothing happens at the predicted time, keep waiting, it may be along in 10-30 minutes.

SEEING MIR: Mir is also the only EZSAT that can bee seen. Mir is very big, about the size of a semi-trailer, and when it comes over just after sunset or just before sunrise, you can often see it go by. This is because Mir will still be in sunlight whil you're in the earth's shadow. In these cases, Mir looks like a very bright star gliding acress the sky. It's a beautiful sight and well worth looking for. It's best to use a tracking program set to VISUAL to find visible passes. The best such programs will even draw you a star map and show you Mir's path across it. Don't forget to tune to 145.55 when you see it. Also, don't forget to get on the local repeater and tell people when you spot it so that others can share in the fun.

OSCAR-21, RS-10/11, RS-12/13

These three satellites are all in 600 mile high polar orbits, which carry them over the US six to eight times a day for 10-18 minutes at a time. They all have orbital periods of about 95 minutes and we typically get two sets of three or four passes spaced 95 minutes apart. The two sets of passes are spaced 12 hours apart and their passes come a little earlier each day because their orbits don't take quite exacly 95 minutes.

These satellites all have a coverage circle about 4000 miles in diameter, so when they're about the horizon, you can use them to work hams anywhere in the conteinental US, Canada, Alaska, Mexico, Central America, South America down to the Equator, the Caribbean, Greenland, Iceland and parts of Scandinavia. Eastern hams can work Europe and the West can work Hawaii.

All of these satellites are in boxes that are bolted to larger Russian satellites and draw their power from the large satellite's solar cells. They are VERY easy to hear and fairly simple to work.

OSCAR-21

My favorite satellite. This is a German/Russian radio that uses a Digital Signal Processor (DSP) chip and it is Flexible with a capital "F"! It was launched in January, 1990 configured as a linear translator which received a band of 70 cm CW and SSB signals and relayed them on 2 meters. The bird was, to put it mildly, under-utilized. Then in 1992 the DSP chip was reprogrammed in orbit into a cross band FM repeater! If you've been wondering if DSP is as powerful as you've heard, now you know! In the past year, it's telemetry has been re-programmed from an obscure format to standard 1200 baud packet. WEFAX pictures (which are uploaded by teh ground controllers) were added in December 1993. (This is the same format used by many weather sats and short wave weather stations.)

OSCAR-21 has an input frequency of 435.016 MHz, but 435.015 works just fine. It's output frequency is 145.987 MHz, but 145.985 or 145.990 will recieve it quite well. It has a strong transmitter and a ground plane antenna and most HTs have no trouble picking its signals up when it passes over. Mobiles and base stations with omni antennas will receive it full quieting. You can get into this bird with 20 watts and a six element beam antenna. I mount my beam on a photo tripod next to my car and run coax to my dual band mobile. You have to point the beam accurately, so I take a list of altitude and azimuth bearing generated by simple tracking software out with me and re-point the beam once a minute. In one summer, I worked the east and west coasts, several Canadians, Texas and Guantanamo Bay, Cuba before fall's cold weather drove me indoors.

Some OSCAR-21 tips: you can hardly get a word in edgewise during "prime time" opening passes. Try the late night passes instead, they're much less crowded. OSCAR-21's transmit and recieve polarity rotate constantly during a pass. Mount your beam so you can easily rotate it for the best signal. Remember, all these ham sats are full duplex, so you can and should monitor your signal on the downlink. (Use headphones.) Turn the beam for minimum noise. You'll probably have to modify your dual band rig to get it to transmit on 435.015. BE CAREFUL beacuse FM is generally NOT appreciated below 440 MHz. Also, the mod may allow you to transmit out of band, which is a real no-no.

OSCAR-21 is also known as RS-14, AO-21 and Rudak-2. It's bolted to a satellite called INFORMATOR-1, which is often abbreviated INFORMTR-1. It's NORAD ID number is 21087. Be careful, the rocket booster that launched the satellite is still up there and it's named INFORMTR-1 R/B in some element sets. Your tracking program may find it instead of the satellite if you're not careful.

RS-10/11

This is probably the easiest satellite to work of them all. It has an incredibly sensitive receiver that can pick up the faintest two meter signal

and relay it on ten meters. There are documented examples of people having QSOs on RS-10/11 by clicking Morse on HTs with rubber duck antennas! I guarantee you that your HT can put a useable signal into RS-10/11, I've done it myself. WARNING: if you try this, disable the microphone so you don't transmit any FM sidebands and turn your CTCSS (PL) OFF!

RS-10/11 (Radio Sputnik) is for CW and SSB signals, so an all mode 2 meter rig is ideal for transmitting to this bird. The input bandpass is from 145.860 - 145.900 and the output freqs are from 29.360 - 29.400 MHz. There is also a morse beacon at 29.357 MHz.

RS-12/13

A cousin to RS-10/11, RS-12/13 is also a 40 KHz wide linear transponder. However, this bird is unique because its input frequencies are in the fifteen meter band! This is also the only ham sat in the sky that requires more than a code free technician license to work it, because its input band is from 21.210 - 21.250 MHz. This straddles the Advanced and Extra portions of the 15 meter band. Its output freqs are from 29.410 - 29.450 MHz. Because of skip, this satellite can often be heard and worked when it's below the horizon! At least one person has earned DXCC on this satellite! RS-12/13 is bolted to the ?????? ???? satellite and its NORAD ID is 21089.

DOVE

DOVE is a transmit-only hamsat. It has no user accessible receiver. Built in Argentina, DOVE was launched in 1990 as a good will satellite. It was originally intened to transmit digitized voice messages that could be picked up by students with simple receivers. Unfortunately, the digital voice hardware and software has been a constant source of problems since launch. Atempts to get DOVE to works properly are proceeding as this is written, so the best bet is to tune your 2-meter rig or scanner to 145.825 MHz and see what the bird is up to currently. Be ready for Morse, standard 1200 baud packet or (with luck) digitized voice messages. The signals are strong enough so that an HT with a rubber duck will hear it when it's overhead, although ground plane antennas will give better coverage when the bird is near the horizon.

ANTENNAS:

For AO-13, the consensus is get to get KLMs, Telex/Hy-Gains, or roll-your own, Nobody liked the Cushcraft satellite antennas - they appear to have problems in wet weather. Bigger is also better, if you have the space. Several people mentioned the KLM 22C and 40CX pair as excellent performers (again - you need the room for those long booms!) KE4ZV stated his pair of KLMs (the big ones!) lets him work AO-13 with 3 to 30 watts (hardline feed and rigorous attention to routing the feedlines and cables properly to maintain the antenna patterns helps, too.). Others mentioned the KLM 14C/18C pair as good performers - but you need more power on the uplink.

Telex/Hy-Gain antennas were recommended by several people as a less expensive alternative to KLMs that work almost as well. There's also M2 (started by an engineer from KLM). While no one who responded uses them,

the information I received from a call to their factory in California suggests they are comparable to slightly better than the KLMs in performance, and about the same in cost. Dave, WB6LFC, said homebrewing antennas is also feasible - it takes work, but attention to detail results in top-notch performance for very little money. Finally, Ross, VE6PDQ, reported good results using a pair of Cushcraft 215WBs on receive.

Problems encountered with AO-13 antennas include routing cables and feedlines off the back of the antennas (to preserve antenna patterns), use of fiberglass cross booms, mounting preamps as close to the feedpoint as possible, and long antenna booms drooping. (Gary, KE4ZV, recommends using a rope to brace the boom or stiffening booms and fiberglass masts internally with foam-in-a-can insulation.)

On antenna rotators, it appears the Alliance UD-100 is no longer made, though it should still show up at hamfests. People with long-boom antennas report the Alliance rotator is too weak to move a big array anyway, and recommended Yaesu's elevation-only rotator or their Model 5400 azimuth-elevation unit.

Antennas for the low-altitude satellites appear to be much less critical. J-poles were most frequently mentioned (the design from the AMSAT Journal?), but dipoles, ground-planes, and yagis are also in use. Several people work RS-10 quite well with antennas in the attic. Best results are with steerable antennas, but the high operator workload during a pass (unless the satellite is just grazing your access circle) almost demands computer control of the rotators.

PREAMPS:

You need a preamp for AO-13. (I can hear the downlink after a fashion on a Ringo fed with cheap coax and a 10 dB preamp in the shack, but it's not communications quality reception!) Only two people mentioned a specific brand name (Advanced Receiver Research and the unit included with the Ten-Tec 2510), so I assume almost any GAsFET preamp in the 20dB gain class is adequate. THE PREAMP MUST (almost always) BE MOUNTED AT THE ANTENNA (check the discussion in Chapter 9 of the Satellite Experimenter's Handbook and you'll see why!). KE4ZV recommends mounting the preamp AT the antenna feedpoint, if your elevation rotator can handle the unbalanced load.

While no one mentioned it (maybe it's obvious), if the antenna is used to transmit (say Mode J) as well as receive (on Mode B, for example), the preamp MUST either include RF-sensed switching, or be switched out of the line before you transmit. TRANSMITTING INTO AN UNPROTECTED PREAMP WILL DESTROY IT INSTANTLY!

Preamps also seem to help on RS-10 (especially with older HF rigs) and on the Pacsats. It seems to be a case of "try it, and get a preamp if it looks like it would help").

RIGS:

Three radios were mentioned by name - Yaesu FT736 (and it's predecessor, the 726 with satellite module), Kenwood TR751 (a mobile-capable 2 meter multimode), and Ten-Tec's 2510. The Ten-Tec unit is out of production. The few units left are selling for about $300-350. I'm sure other multi-mode radios, and setups with converters and transverters work well, too - it's just that no one mentioned any by name.

Power output required is a function of the satellite, your antennas, and how badly you want to communicate. [QRP on the satellites is just like QRP on HF - you need good antennas and feedline, you have to pick optimal passes, and skilled operators at both ends are needed. Given the apparent "calmer" operating style on AO-13, QRP is probably easier there than on 20 meters!]

Anyway -about power for AO-13. 3-30 watts will work if you have top-notch antennas (KE4ZV). KC7IT uses 50-100 watts (Ten Tec 2510, Mirage D1010 amplifier, KLM 14C/18C fed with 50 feet of 9913). Both KE4ZV and KC7IT use Mirage D1010 amplifiers on 70 cm when they need a little extra power. For an "optimum station", WA5ZIB recommends 60 watts on 70 cm and 80 watts on 2 meters for AO-13, assuming good antennas (Telex/Hy-Gain or better) and feedlines, and 20 watts to a 5' dish for Mode L. Andy emphasized that you can get by and have lots of fun with much less!

For Mode A, WA5ZIB said 6 watts to the AO-13 2 meter antenna will work well. People using omnis report success with the Pacsats running 50-70 watts to a J-Pole (N5VGC). Several people said they (or someone they know) have no trouble using RS-10 at lower power (10-25 watts) with simple, omnidirectional antennas. Again, it's a case of "try it and see if it works."

There was unanimous consensus that the receiving quipment (antenna, preamp, feedline, and receiver) is more important than the transmit equipment. Running more power "to hear yourself" is frowned upon, to say the least! It's also important to be able to vary uplink power to adjust to specific conditions. Both the Ten Tec 2510 and the Yaesu 736 have continuously variable power output (I guess the rest of us just have to fiddle with the drive controls on our rigs!).

ACCESSORIES AND OTHER STUFF:

You need a PSK modem to use the Pacsats. PacCom makes fully assembled units, either already integrated with their own TNC, or as a board you install in your TNC-2 clone. They make similar 9600 bps units for accessing UO-22. The downlink receiver (on 70 cm) should be capable of being tuned by the PSK modem's AFC lines. Newer radios can use the up/down lines from the microphone jack or an accessory connection on the rear panel. Older radios must be modified, or be tuned manually. N5VGC told me he sees about 20KHz of doppler on an AO-16 pass, and that without automatic tuning, operator workload is too high to do much else besides tune the receiver!

Just about any radio suitable for packet on 2 meters will work for AO-16, WO18, and LU-19. To run 9600 bps on UO-22, modifications to bypass the microphone and speaker's audio processing circuits are required. I've seen some reports on rec.radio.packet and in the various Hamsat columns that

differences between UO14 and UO-22's transmitters make UO-22 more difficult to copy. (I'll worry about that problem later - I'll start with AO-16 and LU-19 first!)

No one mentioned computers - again, it must be obvious (also, we're "talking" using computers!). They're handy, and you need one IN THE SHACK when working the Pacsats or for automated, real-time control of antenna rotators (useful for low altitude satellites).

Other operator aids mentioned, or I thought of on my own: If your radio can't slave uplink and downlink tuning (Ten Tec 2510 and Yaesu 736 can), you need something to help convert between uplink and downlink frequencies (and account for doppler shift and calibration errors on the radios' frequency readouts). A cardboard slide scale or dial will work. I'm thinking of programming my HP48 to do the conversion for me. You need something like this to know where to tune on the uplink to hear a given downlink frequency.

Software to track satellites and predict passes. There are many programs that work. Price ranges from free to $70 for state-of-the-art QuickTrack or InstantTrack (available from AMSAT). Special software is also needed to use the Pacsats, and to interpret telemetry data. This software is also available from the usual ham sources, and from AMSAT (BTW, software sales support the amateur satellite program!)

Polarity switchers optimize antenna performance by allowing switching antenna feeds from RHCP to LHCP as the need arises. They are a very useful add-on, but don't appear essential.

Equipment to measure power output, SWR, transmit frequency - all useful (see - satellites are not that different from HF!).

311. APRS operations on 145.79???

Newsgroup: rec.radio.amateur.space
Date: 1994-03-01 05:52:41 UTC
From: russell@spdcc.com
Message-ID: <CLz1nv.2sn@spdcc.com>
Source record: 28065
Cross-posted to: rec.radio.amateur.space,rec.radio.amateur.digital.misc

Hello all,

Recently, amateurs in the Omaha area where I live have been looking into
getting an APRS network set up, and one thing that's been a concern of
several people (myself included) is the fact that the "standard" frequency
that is being used for APRS is 145.79 mHz.

This seems to us to be much too close to the 145.80-146.00 satellite
band, especially given the fact that APRS is designed for wide-area operation
and people will probably be running some high-powered digipeaters, at least
on a temporary basis for special events and probably on a permanent basis.

It has also been mentioned that this frequency falls in a subband that
has been suggested for experimental uses, and a permanent packet network
based on established AX.25 protocols hardly seems experimental.

What do you think? Are we being paranoid, or is it just that APRS
isn't popular enough for people to have noticed? I'd like to see this
discussed before people sart putting up fixed-frequency remote digis, etc
that will be VERY hard to get moved. APRS looks like a great system, and
I think it does need a coordinated frequency, but I don't think 145.79
should be that frequency.

Source record: 28067

Thanks a lot. Your posting gave me all the information I have been hunting around for in the last 6 months. A lot of documents exists that will give you a general overview on the topic, but none has all the precise and up to date information one needs in order to actually start listening for satellites on the bands. This was very much needed. Thanks again.

Forget about building the actual receiver, I don't believe that mere mortals would have much success -- the GPS signal is extremely complicated.

You can, however, buy an OEM GPS receiver (mine was a Magellan) and build a handheld case and display around it. That's what I did. I used a Motorola 68HC705 microprocessor and a 16x2 LCD display. The boards use regular asynch serial at normal baud rates for communications, so interfacing is really easy.

At the time, however, the price of complete handheld units was much higher than the cost of the receiver boards. That's not really true any more. The board I bought was about $400, which is in the ballpark of what you can get complete GPS units for now.

I have been asked to look out for a program called SATNODE for the PC, which acts as a gateway to the packet satellites and allows unattended operation with automatic forwarding etc...

TrakSat 3.00 or something earlier? I've run 2.7, 2.8 and 3.0, and
it appears to me that 3.0 takes a step backwards. OK, it's completely
re-written in C, and it has nice pull-down menus plus a couple of new
[relatively small] features, but it's slower than 2.8, the map it draws
for ground-tracks is distorted (stretched out vertically), AND it's buggy
(it crashes my PC easily if I make minor configuration errors). I have
a list of a number of bugs that I'm about to send to the author, along
with registration money for version 2.8!

I'm sticking with version 2.8 for now! TrakSat 2.8 is clearly my
favorite tracking program, and I've tried most all of the publicly
available ones at one time or another (though I must admit PCT is pretty
nice too).

Anyone else have similar experience with the "new" TrakSat?

Ah, but which version of STSPLUS is it ? The damned thing gets updated
two or three times a year, or so it seems. The version numbering is pretty
unusual as well. For what it's worth, the latest I've seen is 9353, which
if I recall the method makes it the last week in '93. 9333 was the last
major upgrade.

Regards
Ian.

I built the majority of a GPS system using a pair of pre-release chips
(GP1010+GP1020) from GEC-Plessey. In the end I never got around to developing
the software. The chipset would cost about $150 now I would estimate. It is
highly unlikely you could build one small enough to use for orienteering etc.
Your best bet is to get a commercial one (they are getting much cheaper now).
Or, alternatively, you could get a PCMCIA plug in GPS card and a small
notebook type computer.

Note that in heavily wooded conditions and near mountains etc, signal
reflections are going to degrade your positioning to about +/- 1/4 mile or
so!

Sorry. Did I say traksat? I actually meant Satra version 1.0. That's the
problem with all these sat tracking progs what to call them.
I have played with tracksat 3 and I found it hard to drive.

322. Space Shuttle Radio Frequency List

Newsgroup: rec.radio.amateur.space
Date: 1994-03-02 16:34:26 UTC

Space Shuttle Radio Frequency List
By Rich Weinkauf, Farmington, MI
STSFRQ03.TXT

A Space Shuttle mission requires the coordination of thousands of individuals; both on the planet, and off. This coordination is directed largely by radio communications, both voice and digital; and supplies the communications enthusiast with several opportunities for listening. The following list includes radio voice communication frequencies reported to be in use during a typical Space Shuttle mission. This list has been gleaned from many sources, including personal communications, messages on Prodigy, Amateur Radio Bulletin Boards, Space and Astronomy Bulletin Boards, and the NASA Spacelink BBS. All of it is subject to change without notice, and reception is dependent on your location and the propagation conditions.

I can be reached for additions, deletions, and corrections to this list via:

Packet radio: N8QLT @ WD8DWO.#semi.mi.us.na

348.400 control tower
358.300 approach control
372.200 dispatchers

International emergency air frequencies (MHz)
121.500
243.000

Shuttle frequencies: (MHz)
296.800 primary, air-to-ground or orbiter-to-suit
259.700 air-to-ground or suit-to-orbiter
279.000 suit-to-orbiter or suit-to-suit

Communications and other stuff: S-band (MHz)
2205.000 Air-to-ground
2217.500 Air-to-ground secondary
2287.500 Air-to-ground primary digital downlink
2041.900 Ground-to-air
2201.400 Ground-to-air
1831.800 primary (USAF uplink, phase modulation)

1775.100 secondary
2250.000 wide band FM with main engine analog
telemetry during launch, or TV during orbit
operations.

Note from Ron Parise, WA4SIR, on above S-band frequencies: "The S-band system is one of the primary orbiter downlink bands. The voice channels are digital slope delta modulation and are MUX'ed in with the rest of orbiter telemetry very difficult to copy. Much of the downlink TV is S-band wide band FM and should be easy to copy.

The Ku-band system is used in conjunction with the TDRS satellites, and is used more heavily during Spacelab flight than others. The data rate is very high digital (50 Mbits/sec), and will be nearly impossible for you to demodulate and decommutate in your basement. Nevertheless, the shuttle transmits on 15.003 GHz. These transmission are directed toward the TDRS satellite with a high gain antenna, and cannot be copied from the gound.

The UHF frequencies are fun to listen to, but are not heavily used except during EVA's. You will almost always hear some activity on them during a mission, just be patient."

Ron WA4SIR

323. Satellite Elements

Newsgroup: rec.radio.amateur.space
Date: 1994-03-02 23:57:23 UTC
From: j2yc@jupiter.sun.csd.unb.ca
Message-ID: <1994Mar2.235723.1769@jupiter.sun.csd.unb.ca>
Source record: 28077

I am testing an HTTP server that is dedicated to ham radio..

Those with mosaic (with form capability) can try it out at
http://jupiter.sun.csd.unb.ca:7000

In the "SPACE" section, there is an option to get the latest
satellite keps... This option will let you compute satellite
trajectories based on info that you enter using the pull down menus.

Another thing I wrote is an online callbook which executes an
expect script to search for a callsign but that has been done
already and isn't very exciting..

The guts to the keplerian element thing I wrote was from "n3emo orbit"
..... a very much hacked apart orbit. It outputs in HTML format
and runs in batch mode using a single command line argument as
provided by mosaic using the "GET" option in the forms..

The HT should work. Try to get on a high rooftop to increase your horizon. A better antenna than the typical duck would be a big help though. Even a homemade J-pole should suffice.

You have a very good chance of hearing MIR on an HT...but keep in mind they are usually doing packet. I have heard MIR on an HT during a voice QSO with W3EAX. All LEO sats can be definately heard with a mag-mount quarter-wave or 5/8 wave vertical, no problem. You only really need satellite antennas to hear elliptical orbit sats such as AO-13.

You have little chance of making it through the typical pileup into either packet or voice modes with an HT. If you were the only ham within the line-of-sight, you might have a chance to hit them, depending on MIR orientation to you.

The program you're looking for was written by John Hansen, WA0PTV. I
believe that he is on the internet at wa0ptv@amsat.org. I'm sure that
he'd be glad to help you out.

If you drop him a line, tell him I said hello!

Yep, it is updated practically monthly. I have 9405 right now. A nice
program. Especially when the shuttle is up and running.

334. NASA pictures

Newsgroup: rec.radio.amateur.space
Date: 1994-03-04 15:28:24 UTC
From: jdoherty@uoguelph.ca
Message-ID: <2l7k2o$jvj@nermal.cs.uoguelph.ca>
Source record: 28088

Does anyone know where to find the satellite pictures of the moon, and
other things, that are currently being received from NASA's Clementine probe?
I heard on the news last night that these pics were available on the
Internet...

Please email: jdoherty@uoguelph.ca

Thanks,
John

=========
SpaceNews
=========

MONDAY MARCH 7, 1994

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It is
published every week and is made available for unlimited distribution.

* AO-13 MODE S REPORT *
======================
With its new operating schedule, AO-13 is now seeing increased activity
during its Mode BS and S periods from users of the 2.4 GHz transponder.
With 4 hours available per orbit, listeners to the S band transmitter are
enjoying strong signals and noise free reception.

Antennas are mainly small dishes from 0.6m to 1m diameter although some
stations are successfully using loop Yagis. With a 1m dish on receive and
a single 19 element yagi on 435, good results can be achieved with 10 to 20
watts.

Stations having good signals on 2.4 GHz last week included:

N2IQU G0ONA ZS6JT VE3GTF JA7EC PT9FH OE6DGV TI5RLI VK6BMD

[Info via David, G0MRF]

* RS SAT
=====================
The following information is supplied by Andy, RK3KPK, the operator of RS3A,
the RS satellite command station:

RS10: Operating normally in Mode A: 145.860 -145.900 MHz uplink
29.360 - 29.400 MHz downlink
Autotransponder "Robot" ....145.820 MHz uplink
29.403 MHz downlink
Very good activity CW from DL,YO,G, HB - (swl RK3KPK),
Also it is possible to use special channel...145.850 MHz uplink
... 29.350 MHz downlink

RS12: Operating normally in Mode K: 21.210 - 21.250 MHz uplink
29.410 - 29.450 MHz downlink

Autotransponder "Robot" .....21.130 MHz uplink
... 29.454 MHz downlink

Please send QSL cards for "Robot" contacts to RK3KPK direct (SAE + I.R.C.):
Andrey Mironow, ul. V-Voloshinoj, d.11, kv.72
station Perlovskaya, 141014, Russia, CIS

or via DF4XW.

RS15: We are waiting for the launch of this satallite this spring.
The main frequencies of RS15 are:
Mode A: 145.857 - 145.897 MHz Uplink
29.357 - 29.397 MHz Downlink
Beacon 1: 29.398 MHz
Beacon 2: 29.351 (???) MHz
Power beacons low/high..... 0.4 - 1.2 Watt
Output of transponder ..... about 5 Watts
Inclination..... about 67 degrees
Height of orbit..... 2,300 Km
Weight of satellite..... about 50 Kg
Antenna..... dipoles
Memory of RS..... about 2 Kb

RK3KPK would like to hear about your DX contacts via the RS satellites.
For example, Andy had a DX contact with YV3... via RS6 in 1982!!! A QSL is
fine. Has anyone had better DX?

Comments to Andy should be directed via his packet radio address:
RK3KPK@RK3KP.RUS.EU or RK3KPK@RS3A.RUS.EU.

* DOVE OSCAR-17 NEWS *
======================
The DOVE spacecraft continues to transmit satellite telemetry and news items
using an AX.25 packet radio format. Shlomo, 4X4LF, in Israel provided the
following beacon reception:

DOVE-1>BRAMST [02/20/94 19:33:28] <UI>:
19th Feb 1994

DOVE reports have been received from :

KB4CYC KB5YVF KB7QLY KC1WD KC2SF
KC3H KC4ZRH KC6ROL KB2BD KD4GAR
KD4GHQ KD4SHL KD4UPF KD6NEW KI0G
KM6JV KMA1JL KR5J KX7L LA5VX

This will change in 3 Days

[vk7zbx]

Too bad they got my callsign wrong. :-)

* FO-20 SCHEDULE *
==================

The FO-20 command station announced that a slight malfunction in the onboard command system had been detected. As a result, analog mode operation arranged from 09-Feb-94 will be performed on schedule, but there is a possibility of interruption due to satellite ground station control.

The present schedule is as announced before:

Analog mode:
09-Mar-94 07:05 -to- 16-Mar-94 07:30 UTC
23-Mar-94 07:52 -to- 30-Mar-94 08:15 UTC

Digital mode: Unless otherwise noted above.

[Info via Kazu Sakamoto, JJ1WTK]

337. Re: GPS Receiver Boards

Newsgroup: rec.radio.amateur.space
Date: 1994-03-04 23:38:11 UTC
From: hunter@s07.es.llnl.gov
Message-ID: <2l8gp3$ikl@lll-winken.llnl.gov>
Source record: 28091
Cross-posted to: rec.radio.amateur.space,rec.radio.amateur.homebrew,rec.radio.amateur.equipment

The Garmin GPS-10 receiver board is less than $350 in quantities of 2 (two). It is an 8-channel
receiver with NMEA output. They can supply a program that runs on a PC and displays the data
from the GPS-10, connected to one of the serial ports. The above price includes the antenna.
One of the reasons that we like it is that is only consumes 1 watt (0.2A @ 5V). Garmin can be
reached at (800)800-1020. Note that this is not an endorsement, etc., etc.....

338. Help with FCC Notification fpr SPACE operations ?

Newsgroup: rec.radio.amateur.space
Date: 1994-03-05 06:21:07 UTC
From: ceham@w3eax.umd.edu
Message-ID: <2l98cj$aae@hecate.umd.edu>
Source record: 28092

Hi, I am trying to find out what exaclty is needed in terms
of an FCC notification for space operations.

We are currently developing an amateur radio experiment / payload
to fly for approximately 48 Hours in a low earth orbit
(space shuttle).

We tried contacting the FCC, but got the run around.
any info would be appreciated in terms of the
notification and STA (if required).

the experiment is basically based on packet radio, and GPS.
will use 2m.

Maurice

339. v2l9331.zip - Hams: Converts raw OSV's to Two-Line Elements

Newsgroup: rec.radio.amateur.space
Date: 1994-03-05 18:45:52 UTC
From: astroman@netcom.com
Message-ID: <9403051845.kp29579@SimTel.Coast.NET>
Source record: 28093
Cross-posted to: comp.archives.msdos.announce,rec.radio.info,rec.radio.amateur.space

I have uploaded to the SimTel Software Repository (available by anonymous ftp from the primary mirror site OAK.Oakland.Edu and its mirrors):

pub/msdos/hamradio/
v2l9331.zip Hams: Converts raw OSV's to Two-Line Elements

The Vector to Two-line Elements (VEC2TLE) software provides the user with the capability to convert position/velocity/time state vectors of a variety of formats to National Aeronautics and Space Administration (NASA) Compatible Two-Line Element (TLE) sets. These element sets contain orbit descriptions compatible for propagation with the Simplified General Perturbations (SGP) and SGP Version 4 (SGP4) orbit theories developed for use by the North American Aerospace Defense Command (NORAD) and United States Space Command (USSPACECOM).

TLEs have become an increasingly-popular source of orbital data. This is due mainly to the fact that this format of data is available for nearly all Earth-orbiting satellites. As a result, the popular satellite tracking software packages such as STSPLUS and TRAKSAT, use TLEs as their primary sources of input data along with the SGP4 orbit propagator.

TLE data is available for most Earth-orbiting satellites from several sources (see Appendix F). VEC2TLE is not intended to replace these as primary sources of TLE data. Rather, its primary purpose is for circumstances in which this data may not be available in a timely fashion. A prime example is the Space Transportation System (STS) where position and velocity state vectors may be the only orbital information available in near real time. In the past, users of the tracking software had little choice but to wait (hours) until the TLE data was available following thruster firings that changed the Shuttle's orbit. It is this situation that resulted in the creation of VEC2TLE. The TLEs computed by VEC2TLE are fully compatible with SGP or SGP4 as true and accurate renditions of the orbit specified by the input state vectors.

Uploaded on behalf of the author.

This sounds interesting, but there's one aspect I don't understand. Where does one obtain the state vectors? I don't recall ever having run across this type of data.

UOSAT-2 TURNS 10 YEARS OLD

HR AMSAT NEWS SERVICE BULLETIN 064.01 FROM AMSAT HQ
SILVER SPRING, MD MARCH 6, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-064.01

UOSAT-2 (UO-11) Celebrates 10 Years Of On-Orbit Service

At 17:59 UTC on March 1st, 1984, the second satellite designed and built by the University of Surrey, UoSAT-2 (UO-11) was launched on a Delta rocket from the Western Test Range at Vandenberg Air Force Base, California.

Among its many experiments, UoSAT-2 carried the Digital Communications Experiment, which was one of the first (if not THE first!) non-military use of store-and-forward techniques with Low Earth Orbiting satellites. UoSAT-2 was an early test-bed for many of the technologies that have since been incorporated into a number of other packet radio satellites.

For all those who wonder how long these satellites last, it should be noted that UoSAT-2 is still operational, ten years after launch!

Happy Birthday UoSAT-2 !!!

[The AMSAT News Service (ANS) would like to thank Eric Rosenberg (WD3Q) for the information contained in this bulletin item. Eric can be contacted at his INT

KE3HP Presents A "Sample" Keplerian Element Set For RS-15

Based on information about RS-15's orbital paramaeters in last week's ANS bulletins, KE3HP has generated a set of predicted elements for this satel-lite. KE3HP assumed that the launch would be from Plesetsk at 12:00 UTC on 01-MAY-94. He generated these elements using OrbiTrack, an excellent MacIntosh shareware program by Bill Bard.

Satellite RS-15 predicted
Catalog Number 99999
Epoch 94 121.57362967 05/01/94 13:46:02 UTC
Drag2 0.00000000 Rev/Day^2
Inclination 67.0000 Deg
RAAN 22.8163 Deg
Eccentricity 0.0001152
Argument of Perigee 360.0000 Deg
Mean Anomaly 0.0000 Deg
Mean Motion 10.73887722 Rev/Day
Epoch Revolution 0

Semimajor Axis 8678.14 km
Precession 1.3232 Deg West/Day
Period 134.09 Min
Apogee 2301.00 KM 1429.77 SM 1242.44 NM
Perigee 2299.00 KM 1428.53 SM 1241.36 NM

The only element strongly influenced by the launch date and time will be RAAN. The primary difference is that these predicted elements will show the satellite passing over your QTH at a different time than when the real bird will. If you take these elements and "plug" them into your satellite tracking programs, one of the facinating features that you will discover about this orbit is that even on a low elevation pass (10 degs or less) RS-15 is visable for up to 20 minutes! This will make RS-15 an excellent satellite for Mode A operations. Please stay tuned to the AMSAT News Service (ANS) bulletins for further information about the launch of RS-15.

[The AMSAT News Service (ANS) would like to thank KE3HP for the information contained in this bulletin item.]

AO-13 OPERATIONS NET

HR AMSAT NEWS SERVICE BULLETIN 064.03 FROM AMSAT HQ
SILVER SPRING, MD MARCH 6, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-064.03

Current AMSAT Operations Net Schedule For AO-13

AMSAT Operations Nets are planned for the following times. Mode-B Nets are conducted on AO-13 on a downlink frequency of 145.950 MHz. If, at the start of the OPS Net, the frequency of 145.950 MHz is being used for a QSO, OPS Net enthusiasts are asked to move to the alternate frequency of 145.955 MHz.

Date UTC Mode Phs NCS Alt NCS

13-Mar-94 0130 B 075 VE2LVC W9ODI
19-Mar-94 1730 B 073 W5IU WA5ZIB
26-Mar-94 2130 B 084 WA5ZIB W5IU

Any stations with information on current events would be most welcome. Also, those interested in discussing technical issues or who have questions about any particular aspect of OSCAR statellite operations, are encouraged to join the OPS Nets. If neither of the Net Control Stations show up, any participant is invited to act as the NCS.

AO-13 ZRO Tests For March 1994

The following schedule of Mode "B" tests were chosen for convenient operating times and favorable squint angles. The tests can be heard on 145.840 MHz. Andy McAlister (WA5ZIB) will conduct all the tests. Mode "JL" tests will no longer occur due to the failure of AO-13's 70CM transmitter.

Day Date (UTC) Time Areas covered

Saturday Mar. 19, 1994 1930 UTC NA, SA, Europe, Africa
Saturday Mar. 26, 1994 2315 UTC NA, SA

Note that the dates and days are shown in "UTC". Any changes will be announced as soon as possible via the AMSAT HF and AO-13 Operations Nets.

All listener reports with date of test and numbers copied should be sent to Andy MacAllister (WA5ZIB), AMSAT V.P. User Operations, 14714 Knights Way Drive, Houston, TX 77083-5640. A report will be returned verifying the level of accurate reception. An S.A.S.E. is appreciated but not required.

SB ALL @ AMSAT < LU3BDH $LU3AGJ20892
* G.R.A.P.S. *

I have the pleasure to announce that on March 1st was constituted the

"G.R.A.P.S" GRUPO RADIOAFICIONADOS ARGENTINO POR SATELITE.
ARGENTINE AMATEURS VIA SATELLITE GROUP.

The objectives of this group are strictly technical, in the developmentt, study and construction of satellite experiments, with the logic ambition that our "LUSAT-1" don't get held in history.

Unfortunately, our technicians lost the oportunity to applicate their knowhow and ambitions in the multi-national Phase-3D.

Our heading is to re-create the experiences of our "LUSAT-1", and others that may come from other countries, sharing the participation and looking forward for the major goal: another satellite!

I invite everyone that want to join the group actively. He/she will have a place, being a ham or not, being universities, technicians, engineers, schools, radio clubs, other institutions, etc.

From here now, we're going to publish bulletins only when a goal is done, as we don't want to create misunderstandings.

To date, the group have this members:

Engineers:
RAUL BON FOSTER, LU5ALG
JUAN CARLOS LUCIANI, LU4AGC
JULIO BIANCHI, LW1DUA
CLAUDIO MARCO ZANELLA, LU4AEY

Technicians:
NORBERTO PENINNI, LU8DYF (LUSAT-1 Control Station)
JUAN CLEMENTE, LU8ENU
OMAR CASTRO, LU5EO

Inventors:
EDUARDO SWEET BIRO, LU7AKC

Director:
MARIO IBERTIS RIVERA, LU2BDT

These ones will manage some experiment teams.

You can contact us via Internet, sending a message to

<graps@asarin.org.ar>

or via Packet radio, sending a PERSONAL message to

graps@lu7akc.#col.cf.arg.soam

or via Fax to

(+54-1) 552-1920 (ask for fax)

or via Voice phone to

(+54-1) 642-1664

NOTE: Please post this message over any net or list.

Sincerely yours, Eduardo Sweet Biro. (February 17, 1994)

343. Re: GPS Receiver Boards

The Motorola GPS receiver is less than $150 in 100's. It has six
channels and just about all the features you would ever want.

345. APT-Satellites: Report MAR 05, 1994

Newsgroup: rec.radio.amateur.space
Date: 1994-03-07 10:36:51 UTC
From: peter.henne@gmd.de
Message-ID: <1994Mar7.103651.29617@gmd.de>
Source record: 28098
Cross-posted to: rec.radio.amateur.space,rec.radio.info

```
Observed at station 50.7 NLat, 7.1 ELon, MAR 05, 1994

NOAA-9: APT 137.62 *OFF*
NOAA-10: APT 137.50 *OFF*
NOAA-11: APT 137.62 On
NOAA-12: APT 137.50 On
Meteor 2-21: APT 137.40 *OFF*
Meteor 3-3: APT *OFF*
Meteor 3-5: APT 137.85 ON again
Meteor 3-6: APT 137.30 *OFF*

NOAA-9 is off due to VHF-conflict with NOAA-11 until
April 09, NOAA-10 is off due to VHF-conflict with NOAA-12
until March 13 (info from wxsat-mail-list (TBUS)).
Meteor 2-21 is off now, notice frequency-change from
137.85 to 137.40 MHz. Meteor 3-5 is active again, now
on 137.85 MHz, transmitting very good vis-images.
```

346. Shuttle Retransmissions

Newsgroup: rec.radio.amateur.space
Date: 1994-03-07 11:43:00 UTC
From: stocker@nssdca.gsfc.nasa.gov
Message-ID: <7MAR199407434590@nssdca.gsfc.nasa.gov>
Source record: 28105

As you may know GARC volunteers undertake to retransmit Shuttle Ground transmissions. Please note the following:

INTERESTED IN SHUTTLE TRANSMISSIONS
The Goddard Amateur Radio Club (GARC)invites interested people to tune in to Shuttle transmissions. As a public service to the Amateur radio community, the GARC retransmits space shuttle air-to-ground communications. During the STS-62 mission, Amateur radio operators, shortwave listeners, and those individuals with scanners can listen to these communications on the following HF (single side band) and VHF frequencies:

3.860 MHz (lower sideband)
7.185 MHz (lower sideband)
14.295 MHz (upper sideband)
21.395 Mhz (upper sideband)
28.650 Mhz (upper sideband)

and

147.45 Mhz (FM) Local DC Metro Area

73 de N3OXM

GARC PI Coordinator

347. Re: Satellite FAQ answers (long)

Newsgroup: rec.radio.amateur.space
Date: 1994-03-07 13:03:38 UTC
From: sgreene@access1.digex.net
Message-ID: <2lf8na$a74@access1.digex.net>
Source record: 28099

An addition to Stephen's amateur satellite FAQ: AMRAD-OSCAR 27 (AO-27) downlink is 436.8 MHZ (actually, its closer to 436.7975), not 436.9. Operating mode is presently analog FM voice at either 0.5W or 2 W downlink transmit power. Uplink is 145.85 MHz, analog FM voice. The satellite is in a schedule placing the amateur payload in use during daytime passes over the Northern Hemisphere. Note that this schedule can change WQxx WITHOUT NOTICE based on the requirements of the "host" commercial EYESAT satellite's mission.

BTW, I've copied the article, and plan to use it for a satellite beginner's forum we'll be holding in the Washington Area next month. And I'm glad that summary I posted back in '93xxx '92 was useful!

73, Steve Greene, ka1lm@amsat.0xxxxxxxxxxxxxxx
ka1lm@amsat.org / sgreene@access.digex.net

(One of thes'e days, I'll get a decent offline mailer!)

348. Re: Mir

Newsgroup: rec.radio.amateur.space

Troyce (Troyce@bio.tamu.edu) wrote:
: According to the latest orbital data, the Mir should be orbiting almost
: directly overhead of me late Friday morning and only about 389 km in
: distance. Would I have any real chance of picking them up (if they're
: transmitting) using only a HT, or would I need a base rig and satellite
: antenna?

An HT should do the trick. I've heard MIR, DO-17, and STS-xx on my HT.
I even talked to the STS folk while I was watching them from the ground.
I told them that they'd just gone into the earth's shadow, and they wondered
how I knew. I told them that they make a pretty bright 'star' as they zip
along, and that I just saw them wink out!

Satellite: STS-62
Catalog number: 23025
Epoch time: 94066.14730123 (07 MAR 94 03:32:06.83 UTC)
Element set: GSFC-007
Inclination: 39.0156 deg
RA of node: 232.0339 deg Space Shuttle Flight STS-62
Eccentricity: 0.0006278 Keplerian Elements
Arg of perigee: 300.7024 deg
Mean anomaly: 59.3165 deg
Mean motion: 15.90383526 rev/day Semi-major Axis: 6679.3410 Km
Decay rate: 0.11E-03 rev/day*2 Apogee Alt: 305.15 Km
Epoch rev: 42 Perigee Alt: 296.76 Km

350. Two-Line Orbital Element Sets (TLE353)

Newsgroup: rec.radio.amateur.space
Date: 1994-03-08 01:55:07 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.763091707@afit.af.mil>
Source record: 28103

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.info.
This week's elements are provided below.

The question is: who's going to be buying in 100's?

352. GPS Recievers and Differential GPS

Newsgroup: rec.radio.amateur.space
Date: 1994-03-08 14:47:54 UTC
From: zawodny@arbd0.larc.nasa.gov
Message-ID: <2li36q$9kd@reznor.larc.nasa.gov>
Source record: 28106

This may be a posting in search of the proper place to be posted.
Scanning the list, several groups seemed likely places to start.

I need to know a bit more about GPS. What sort of spatial resoultion
can I expect from a hand held GPS receiver? I am not asking about accuracy
(knowing exactly where I am), but rather about how far I have to move before
the GPS can tell me that I have moved. Is 10 or 20 feet obtainable with
handheld equipment? I've been using Loran-C with 0.01 arc minute display
resoultion and it just isn't enough for my needs. Do any of the hand held GPS
units have an extra digit (0.001 arc minute or 0.1 arc second)?

I know that very high precision (centemeters) is possible using the GPS
in a differential mode? Is this an easy arrangement to set up? How is it
done? Any references to the published literature are welcomed.

Finally, do you have any recommendations, either pro or con, on buying
a hand held GPS receiver?

TIA,

I'm looking for information on receiving packet radio satellites on VHF.
I've got a packet radio decoder and VHF receiver, what I need is....

Name Of Satellite
Frequency
Type of transmission (aerial type)

Any information would be greatly appreciated.

Thanks

Mark

354. Two-Line Orbital Element Set: Space Shuttle

Newsgroup: rec.radio.amateur.space
Date: 1994-03-08 22:43:33 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.763166613@afit.af.mil>
Source record: 28108

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

Regarding my posting about Motorola GPS receiver boards:

It seems to have generated a lot of email.

Please get information directly from Motorola's Position
and Navigation Systems Business division if you
are interested. Call (708)-480-8000 and then follow the
directions about calling (800)-4-ONCORE. No, I don't
know what they cost in unit quantities. No, I haven't
hooked one up to my ham station. No, I am not interested
in coordinating a group purchase. I'm just giving you a
pointer to further information. Thank you.

Rick Karlquist N6RK

So where do you get one in the "ones". Eagle's is $498 and
has 5 channels as I remember. Just what do you get with more
than 5 channels?

I've used STSPLUS, TRAKSAT and PCTRACK without problems. All these programs have been developing very fast, so it's possible you've been unlucky. So far, I've yet to fault any of them. PCTRACK appears to run in very little memory, but the other two do need a fairly empty machine. None of them are very fond of TSRs, although I suspect that this more of a timing problem than a memory one.

Regards
Ian.

* UoSAT-OSCAR-11 NEWS *
==========
The following is from the UoSAT-OSCAR-11 satellite control center and is currently being transmitted by the spacecraft on its VHF downlink:

Surrey Satellite Control Centre
University of Surrey
Guildford, Surrey GU2 5XH
England

February 8, 1994

Greetings to all UO-11 users around the world.

As followers of this mission know, during the past several months UO-11 has experienced some problems which have led to a disruption of regular services. Thanks to the efforts of G8NOB and a core of engineers at UoSAT, we can report that the spacecraft has been returned to a reasonable operating state.

We are now going to take this opportunity to make some adjustments to the UO-11 operating schedule. For the past several weeks the spacecraft has been exclusively transmitting binary WOD and telemetry data. This step has been taken to allow us to download the maximum amount of data as possible for diagnostic purposes. This will continue for the foreseeable future. However, we understand that many of the UO-11 tracking stations around the world are only equipped for ASCII data format, therefore we are proposing to set aside two days a week, Wednesday and Saturday, where the primary data format will be ASCII. The spacecraft will transmit ASCII WOD, telemetry and bulletin material during this period in addition to short durations of binary telemetry. In addition, ASCII bulletin material will be included in the daily transmission cycle so that bulletin material may be available daily.

As of 09-Feb-94, the 2.4 GHz beacon aboard UO-11 has been activated. This beacon will be left on whole orbit as long as the power budget permits. We would be interested in reception reports and observations of the 'S' band transmissions from UO-11.

More activities are planned, memory space aboard the spacecraft limits us from going into more detail in this bulletin. Watch this space for more details. We are interested in your comments, please let us hear from you at the address above.

73, G0SYX for UoSAT

* FO-20 SCHEDULE *
==========
The FO-20 command station announced that FO-20 will be placed in Mode JA (Analog transponder mode) during Field Day 1994 (25-Jun-94 18:00 UTC through 26-Jun-94 18:00 UTC).

The current operating schedule is as follows:

Analog mode:
09-Mar-94 07:05 -to- 16-Mar-94 07:30 UTC
23-Mar-94 07:52 -to- 30-Mar-94 08:15 UTC

Digital mode: Unless otherwise noted above.

[Info via Kazu Sakamoto, JJ1WTK]

* AWARD NOMINATIONS SOUGHT *
==========
The Westlink Report ham radio newsletter indicates that the nominating period for its annual Young Ham of the Year Award closes on Saturday April 30th.

The Westlink Report Young Ham of the Year award was conceived back in 1986 to honor the younger members of the Amateur Radio Community.

This is not a prize drawing or lottery! There is no filing fee or any other charge to submit a nomination. However, the sponsors of this young peoples award have set very strict criteria for who may even be nominated. A nominee must be age 18 or younger, must hold a valid United States Amateur Radio license issued by the FCC and he/she must have, in the eyes of the judges, made a significant contribution to the nation, to his/her community, to the Amateur Service (or any combination there-of) through the use of Amateur Radio. All nominating packages must include detailed information on and proof of any claim made for the person being proposed to receive the award.

By way of example (and exaggeration) -- nominating a 5 year old Extra Class ham whose only achievement has been attaining his/her Extra class license by age 5 would only prove that wrote memorization is possible in a young child and nothing more. Such a nomination would be rejected by the judges. Let that same 5 year old Extra run an Emergency Net for 72 hours following a 7.7 earthquake and you have a situation where the judges would give careful consideration.

With corporate underwriting from Yaesu USA Corporation, the 1994 winner will receive a trip to the Sea Pac convention in Seaside Oregon (June 4-5), a piece of ham radio equipment and a special plaque denoting his or her accomplishments to the Amateur Radio service.

All nominations must be submitted on an official application available for a Self Addressed Stamped Envelope to the Westlink Report Young Ham of the Year, 28197 Robin Avenue Saugus California 91350. (Application requests not accompanied by an SASE will be discarded.)

The name and call sign of the individual selected as the 1994 Westlink Report Young Ham of the Year for 1994 will be announced in early May.

For further information please contact Burt Hicks WB6MQV at (805) 251-5558 or Bill Pasternak WA6ITF at (805) 296-7180

370. Wanted: Satellite antennas and/or recommendations

Newsgroup: rec.radio.amateur.space
Date: 1994-03-11 21:40:45 UTC
From: debaker@bnr.ca
Message-ID: <2lqogt$46o@crchh7b0.bnr.ca>
Source record: 27974

Greetings fellow satellite enthusiasts,

I am in the process of setting up a satellite system, and I am looking for antennas and accessories, or recommendations for antennas and accessories you like/don't like.

Also, if you know of any good references for building antennas, power dividers, measuring feedlines, building switching pre-amps, home brewed az-el rotators, or any of those other satellite related things, I would like to hear from you.

I am specifically interested in satellite antennas & accessories for 2m, 70cm, 24cm, and 13cm.

Thanks!

```

371. Two-Line Orbital Element Set: Space Shuttle

Newsgroup: rec.radio.amateur.space
Date: 1994-03-12 00:58:41 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.763433921@afit.af.mil>
Source record: 27975
Cross-posted to: rec.radio.amateur.space,rec.radio.info

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

Astronaut to Russia

Astronaut Ken Cameron, KB5AWP, has been named Director of Operations-Russia and manager of NASA operational activities at Star City and at the Russian control center at Kaliningrad.

He will work with Russian Space Agency engineers and flight controllers on the US-Russia cooperative space program, including supervising NASA astronaut training at Star City and developing plans and procedures to support joint space shuttle-Russian Mir space station flights and space station development.

He is expected to command one of the early shuttle docking missions with Mir.

Cameron, 44, has flown on two SAREX shuttle flights, STS-37 in 1991 and STS-56 in 1993. Both these shuttles were ''all-ham flights.''

I thought that STSPLUS had tracked multiple sats since version 9333.
Having said that, there appears to be several new versions per year,
so a 94?? has probable appeared. For some reason, STSPLUS has always
been hard to get via FTP. The BBS is the best place and CIS appears
to be kept up to date. FWIW the latest I've seen is 9353.

Regards
Ian.

W3IWI Explains A Propagation Phenomenon Observed By IT9XXS

Giovanni Mazzola (IT9XXS) posed a question about a propagation phenomenon he has been noticing on KO-23, KO-25, UO-22 and other digital satellites. He reported that he has regularly observed that at the end of the pass, when the satellite is between 0 and -2 degrees elevation, the signal exhibits three strong peaks. During the pass it may be S4 but when the three peaks in signal strength occur, they are over S9. After that he loses the signal altogether. He notes that he has a good horizon, looking out to the sea to the north.

Ton Clark (W3IWI) offers the following explanation: What IT9XXS is observing is classic and very predictable. It is the result of two physical effects: atmospheric refraction and "Lloyd's Mirror" reflections.

The earth's atmosphere bends the signals so that your "radio" horizon is below the physical horizon. The refractive index of the air is about 300 parts per million different from unity depending on the temperature and water vapor content of the air. This is precisely the reason that most line-of-sight computations of terrestrial paths increase the effective radius of the earth by about 1.33. Under some tropospheric conditions like when the temperature increases with height and/or when anomalous water vapor content is present, ducting can occur and VHF/UHF paths may extend to thousands of kilometers. This is especially true of over-water paths like the frequent duct that occurs between southern California and Hawaii or between Italy and Spain. Since the path in question is over water, this is probably the reason signals are received from the satellite when it is below the apparent horizon.

The second effect that is occurring is a reflection of the signals from the water, so the antenna is receiving two different signals. In optics this is often called the "Lloyd's mirror" effect. When the signal is reflected, its phase is changed by 180 degrees, so the direct and reflected signals arrive at the antenna out of phase and cancel at the horizon. At other elevations, the two signals traverse different paths so the phase difference of the direct and reflected signals varies, and the signals may either add constructively (increasing the signal

strength) or destructively (causing a null). If the angles at which maxima and minima signal were known, it would be possible to compute the height of receiving antenna above the level of the sea (reflector).

This reflection effect was first seen in about 1947 when some Australians observed the radio "star" Cygnus-A from an antenna atop a sea cliff. The fact that they observed deep nulls allowed them to demonstrate that Cygnus-A was a compact object, smaller than a few arc-minutes in diameter and not a large-scale feature of the previously discovered radiation from our Milky Way galaxy. This work was done at VHF frequencies not far from our 2M amateur band.

[The AMSAT News Service (ANS) would like to thank Tom Clark (W3IWI) for this explanation and IT9XXS for posing the question.]

N5QWL Provides A "Fact" Sheet For The Upcoming STS-59 SAREX Mission

Shuttle Amateur Radio Experiment (SAREX) Fact Sheet

STS-59 Space Shuttle Endeavour

When: Planned Launch April 7, 1994 at 12:07 UTC for 9 days of 2M operations.

Where: Earth Orbit. Altitude 220 kilometers, with radio coverage of latitudes from 70 degrees North to 70 degrees South. We are in one of the lowest altitude orbits ever flown by the shuttle, so pass times will be shorter than usual.

Operators: Dr. Jay Apt (N5QWL) and Dr. Linda Godwin N5RAX. N5QWL is the commander of the Blue Shift aboard Endeavour and will operate the shuttle systems during the "night" shift, while N5RAX is the Payload Commander, responsible for overall operation of three large radars in the shuttle's cargo bay during the "day" shift.

Modes: FM Voice
VOICE CALL SIGNS: N5QWL and N5RAX
Packet (Beacons giving daily mission activities daily if we get a chance, and robot QSOs -- successful connects will be issued a contact number by the robot) PACKET CALL SIGN: W5RRR-1

Frequencies: We will operate split.
PLEASE DO NOT TRANSMIT ON THE DOWNLINK FREQUENCY!

VOICE: Downlink (shuttle transmits) on 145.55 MHz
Uplink (ground transmits) on 144.91, 144.93, 144.95,
144.97, and 144.99 (except over Europe) - we'll listen
on those 5 frequencies to spread out the pileup a bit.
Uplink for Europe only: 144.80, 144.75, 144.70

Successful QSOs on voice will be facilitated by using
standard international phonetics for your call sign.
We will not answer any stations using non-standard
phonetics. Use your entire call sign -- we log with an
audio tape recorder. Do not use our call sign --
passes are very short, and we want to work as many
folks as possible.

PACKET: Downlink (shuttle transmits) on 145.55
Uplink (ground transmits) on 144.49 (worldwide)

If you can, decrease your radio's deviation to 3 KHz (most are
initially set at 5 KHz) and compensate for the Doppler shift. If
you cannot, wait until a minute or 90 seconds after we come over
your horizon to transmit -- that will put you within our IF. If a
station transmits without following these suggestions, we just hear
what sounds like a noisy carrier. The above applies to both voice
and packet.

QSL via: ARRL, ATTN: STS-59 QSLs, 225 Main Street, Newington, CT 06111,
USA. Include a self-addressed stamped envelope (SASE). Non-US
stations include a self addressed envelope with $0.50 of US
postage affixed or appropriate IRCs. Include the Callsign worked,
Date, UTC, Mode, and Frequency. For packet contacts, include the
QSO number issued by the robot. SWL QSL's: Include the Callsign
heard, Date, UTC, Mode, and Frequency.

Information during the mission: AMSAT bulletins, Compuserve, Genie,
Prodigy, local packet bulletin boards,
ARRL bulletins, and HF voice from NASA
Johnson Space Center ARC, Houston, Texas,
W5RRR, or NASA Goddard Spaceflight Center
ARC, Greenbelt, Maryland, WA3NAN,
frequencies listed below.

W5RRR may be found on or near: 7.215, 14.280, 21.360, and 28.400 MHz.

WA3NAN retransmits NASA Select Audio and SAREX bulletins simultaneously on
or near 3.860, 7.185, 14.295, 21.395, and 28.650 MHz.

The NASA Info BBS at Johnson Space Center, Houston, will also carry
Keplerian elements and SAREX bulletins. (713) 483-2500, 1200 baud,
8-N-1. At the "ENTER NUMBER:" prompt, type 62511 <return> and log onto the
BBS. The Keps and bulletins will be in the welcome message. Disconnect
rapidly to facilitate access by others.

Operations Notes: If you have a packet QSO number issued to you by the
robot, don't try to get another one! Our on-board

program drops the duplicates anyhow, and all you
are doing is making it harder for the other folks. We'll
issue you a QSL card if you appear in the "heard" list on
the TNC and we have issued you a QSO number...that's a
2-way contact, AND REMEMBER, THIS IS ONLY A HOBBY!

N5QWL will be asleep over most USA passes, and N5RAX will be busy with
assigned duties for most daylit US passes, so try us on packet over the
USA if the sun is up. Remember, our packet call sign is W5RRR-1. We'll
try to work voice (1) when we are not otherwise engaged, and (2) at night
or when the ground is cloudy (we are generally busy taking pictures of the
Earth during clear daylight passes).

If I can get to it, I'll activate the SAREX about 3 hours into the mission;
deactivation will occur at about 8 days, 17 hours after launch (unless we
get a one-day science mission extension, then it will be deactivated at
about 9 days, 17 hours after launch).

AO-13 OPERATIONS NET SCHEDS

HR AMSAT NEWS SERVICE BULLETIN 071.03 FROM AMSAT HQ
SILVER SPRING, MD MARCH 12, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-071.03

Current AMSAT Operations Net Schedule For AO-13

AMSAT Operations Nets are planned for the following times. Mode-B Nets are conducted on AO-13 on a downlink frequency of 145.950 MHz. If, at the start of the OPS Net, the frequency of 145.950 MHz is being used for a QSO, OPS Net enthusiasts are asked to move to the alternate frequency of 145.955 MHz.

Date UTC Mode Phs NCS Alt NCS

19-Mar-94 1730 B 073 W5IU WA5ZIB
26-Mar-94 2130 B 084 WA5ZIB W5IU

Any stations with information on current events would be most welcomed. Also, those interested in discussing technical issues or who have questions about any particular aspect of OSCAR statellite operations, are encouraged to join the OPS Nets. If neither of the Net Control Stations show up, any participant is invited to act as the NCS.

AO-13 ZRO Tests For March 1994

The following schedule of Mode "B" tests were chosen for convenient operating times and favorable squint angles. The tests can be heard on 145.840 MHz. Andy McAlister (WA5ZIB) will conduct all the tests. Mode "JL" tests will no longer occur due to the failure of AO-13's 70CM trans-mitter.

Day Date (UTC) Time Areas covered

Saturday Mar. 19, 1994 1930 UTC NA, SA, Europe, Africa
Saturday Mar. 26, 1994 2315 UTC NA, SA

Note that the dates and days are shown in "UTC". Any changes will be announced as soon as possible via the AMSAT HF and AO-13 Operations Nets.

All listener reports with date of test and numbers copied should be sent to Andy MacAllister (WA5ZIB), AMSAT V.P. User Operations, 14714 Knights Way Drive, Houston, TX 77083-5640. A report will be returned verifying the level of accurate reception. An S.A.S.E. is appreciated but not required.

SB SAT @ AMSAT $ANS-071.04
WEEKLY OSCAR STATUS REPORTS

HR AMSAT NEWS SERVICE BULLETIN 071.04 FROM AMSAT HQ
SILVER SPRING, MD MARCH 12, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-071.04

Weekly OSCAR Status Reports: 12-MAR-94

AO-13: Current Transponder Operating Schedule:
L QST *** AO-13 TRANSPONDER SCHEDULE *** 1994 Jan 31-Apr 04
Mode-B : MA 0 to MA 90 |
Mode-BS : MA 90 to MA 120 |
Mode-S : MA 120 to MA 145 |<- S transponder; B trsp. is OFF

Mode-S : MA 145 to MA 150 |<- S beacon only
Mode-BS : MA 150 to MA 180 | Blon/Blat 180/0
Mode-B : MA 180 to MA 256 |
Omnis : MA 230 to MA 30 | Move to attitude 240/0, Apr 04
[G3RUH/DB2OS/VK5AGR]

FO-20: The following is the current schedule for transponder operations:
ANALOG MODE:

23-MAR-94 7:52 -TO- 30-MAR-94 8:15 UTC

DIGITAL MODE: Unless otherwise noted above.
[Kazu Sakamoto (JJ1WTK) qga02014@niftyserve.or.jp]

RS-10: Still operating normally for ZS6AOP. The usual regular stations are often found working thru the satellite as well as the "odd" new comer. Reports of copying the beacon while well below the horizon, over the South Pole on south-to-north passes with good signal strengths have been coming in. Hopefully, with more stations becoming active there will be some real long distance sub-horizon contacts soon. [ZS6AOP]

RS-12: RS-12 is currently operating in Mode K. The uplink passband is 21.210 - 21.250 MHz with downlink on 29.410 - 29.450 MHz. The transponder is non-inverting USB or CW, i.e., if you are on 21.225, then listen on 29.425 +/- the doppler shift, adjust your transmit frequency as you work the satellite to keep the downlink frequency constant. The beacon frequencies are 29.408 MHz or 29.454 MHz. The Robot operates on 29.454 MHz. The uplink frequency for the the Robot is 21.129 MHz. When the Robot is not operating, this freq-uency pair can also be used for general QSOs.
[KB8FGC @ KC8TW.#swoh.usa.na]

AO-21: This OSCAR sends down beautiful signals, 59+ signals about 90% of the time. Along with DOVE, ZS6AOP can recommend AO-21 to anyone who wants to start capturing and examing telemetry using basic equipment. [ZS6AOP]

AO-16: Operating normally. [WH6I]

LO-19: Operating normally. [WH6I]

IO-26: Operating normally. [WH6I]

KO-23: Operating normally. [WH6I]

KO-25: Operating normally. KO-25 has a number of new earth images this past week. So far WH6I notes that he has not seen any pictures that were particularly interesting to him. [WH6I]

AO-27: There is no particular schedule transponder schedule per se, and the way it works is that amateur radio section of the satellite has only solar cell illumination to power it so as to not strain the drain of on board battery power on the commercial side. Therefore, if your

using ITRACK OR QUICKTRACK watch the sun terminator (sun darkness line) when it crosses into the light, the Analog repeater turns on but not until it is in sunlight. N4OUL's own experience is that he has worked it with a hand held ICOM-2AT on low power 2.5 W into 4 el 2M antenna and was full quieting stateside. Also VE3BDR worked it with a portable low power with a mag mount. Uplink on 2M is FM at 145.850 MHz and downlink on FM at 436.800 MHz. [N4OUL]

The AMSAT NEWS Service (ANS) is looking for volunteers to contribute weekly OSCAR status reports. If you have a favorite OSCAR which you work on a regular basis and would like to contribute to this bulletin, please send your observations to WD0HHU at his CompuServe address of 70524,2272, on INTERNET at wd0hhu@amsat.org, or to his local packet BBS in the Denver, CO area, WD0HHU @ W0LJF.#NECO.CO.USA.NOAM. Also, if you find that the current set of orbital elements are not generating the correct AOS/LOS times at your QTH, PLEASE INCLUDE THAT INFORMATION AS WELL. The information you provide will be of value to all OSCAR enthusiasts.

Pete, the main thing you need to know about the program is that it
works best with a math co-processor and/or a fast cpu, 20 MHz or
higher. It is an excellent, well written program for tracking satellites.

I recently saw version 9405 on a local Fidonet bbs where I hang out.
The archive date is 280194. The author of STSPLUS dates his releases
by the year (94) and the week (05) of release.

I will check to see if it is on any ftp sites.

382. Portable AO-13 operation

Newsgroup: rec.radio.amateur.space
Date: 1994-03-14 18:26:44 UTC
From: zlau@arrl.org
Message-ID: <1994Mar14.182644.8734@arrl.org>
Source record: 27986

Looks like Mode S is the way to go for most
portable station that can work well through
AO-13. Maybe that is why they have Mode B
receiving contests--takes a lot more work to
hear the transponder noise floor....

As I thought, as confirmed by G3RUH in a
recent published letter, the beacon uses
all the transponder power, thus you
want to be *weaker* than the beacon.
During a busy pass, I guess this means you
want your signal to be at least 6 dB
weaker, to accomodate at least 4 users.

My 2 foot dish for for 2.4 GHz receive
is probably too big, I'll be trying a
small helix with a 0.4 dB system NF converter
when (if?) the weather gets nice outside.

Wonder if anyone has gotten the HP PHEMT
to work well on this band? The data sheet
says a device NF of 0.13, but given the
error inherant in such a measurement, it
might be no better than other PHEMTs. I'll
be bringing something to the West Coast
VHF conference for comparison.

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

Changes: new mailing lists, .packet rmgroup, and .policy updates

(Note: The following is reprinted with the permission of the author.)

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info,
and rec.radio.swap newsgroups. It is intended to serve as a guide for the new
reader on what to find where. Questions and comments may be directed to the
author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@oac.hsc.uth.tmc.edu. This message was last changed on 18 September
1993 to add the mailing lists for the new rec.radio.amateur newsgroups, to
note the rmgroup of rec.radio.amateur.packet, and to officially retire some
(in)famous threads of discussion on rec.radio.amateur.policy.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

As the net grew, and as packet radio came into vogue, packet discussion began
to dominate other topics in the group and on the list. This resulted in the
logical solution: a group was created to hold the packet discussion, and
another corresponding mailing list was created as well: net.ham-radio.packet
and PACKET-RADIO, respectively.

These two groups served for several years, and went through Usenet's Great
Renaming essentially unchanged, moving from net.ham-radio[.packet] to
rec.ham-radio[.packet]. Readership and volume grew with the rest of the
network.

The INFO-HAMS mailing list was originally run from a US Army computer at
White Sands Missile Range, SIMTEL20. There were few problems with this
arrangement, but one was that the system was not supposed to be used for
commercial purposes. Since one of hams' favorite pastimes is swapping
gear, it was natural for hams to post messages about equipment for sale
to INFO-HAMS/rec.ham-radio. This ran afoul of SIMTEL20's no-commercial-use
restriction, and after some argument, a group was created specifically
```

for messages like that: rec.ham-radio.swap. This group wasn't gatewayed to a mailing list, thus avoiding problems.

While all this was happening, other folks wanted to discuss other aspects of the world of radio than the personal communications services. Those folks created the rec.radio.shortwave and rec.radio.noncomm newsgroups, and established the precedent of the rec.radio.* hierarchy, which in turn reflected Usenet's overall trend toward a hierarchical name structure.

The debate between proponents of a no-code ham radio license and its opponents grew fierce and voluminous in late 1989 and 1990. Eventually, both sides grew weary of the debate, and those who had not been involved even more so. A proposal for a newsgroup dedicated to licensing issues failed. A later proposal was made for a group that would cover the many recurring legal issues discussions. During discussion of the latter proposal, it became clear that it would be desirable to fit the ham radio groups under the rec.radio.* hierarchy. A full-blown reorganization was passed by Usenet voters in January 1991, leading to the overall structure we now use.

After the reorganization, more and more regular information postings began to appear, and were spread out across the various groups in rec.radio.*. Taking the successful example of the news.answers group, where informational postings from across the net are sent, the group rec.radio.info was created in December, 1992, with Mark Salyzyn, VE6MGS, initially serving as moderator.

In January, 1993, many users started complaining about the volume in rec.radio.amateur.misc. This led to a discussion about a second reorganization, which sparked the creation of a mailing list by Ian Kluft, KD6EUI. This list, which was eventually joined by many of the most prolific posters to the ham radio groups, came up with a proposal to add 11 groups to the rec.radio.amateur hierarchy in April 1993. The subsequent vote, held in May and early June, approved the creation of five groups: rec.radio.amateur.digital.misc (to replace .packet), .equipment, .homebrew, .antenna, and .space.

The Current Groups

I can hear you asking, "OK, so this is all neat history, but what does it have to do with me now?" The answer is that the history of each group has a direct bearing on what the group is used for, and what's considered appropriate where.

The easy one is rec.radio.amateur.misc. It is what rec.ham-radio was renamed to during the reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize

this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, should be removed by September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is now rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there.

The first reorganization added two groups to the list, one of which is rec.radio.amateur.policy. This group was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The other added group is rec.radio.cb. This is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently Mark Salyzyn, VE6MGS. The email address for submissions to the group is rec-radio-info@ve6mgs.ampr.ab.ca. Inquires and other administrivia should be directed to rec-radio-request@ve6mgs.ampr.ab.ca. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas,

commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

A Few Words on Crossposting
===========================

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

>fiberglass crossboom, the two antennas boresite to the same point in
>space, the feed networks are good, they're more or less immune to
>environmental issues like rain and ice, and antenna mechanical construction
>is sound. (The extra gain over the AOP package doesn't hurt either.)

I had the AOP package and it worked fine, except when the satellite
was marginal. I had a 100W amp and this did not help the strength
of the uplink. Downlink is OK and aided with an in-shack GaAs
preamp. I upgraded to the 40CX which degraded with time. Turned out
the minibox housing the relay was not entirely sealed, filled with
water and ruined the SWR/performance. Make sure that box is well
sealed! I'm still using the AOP 2M ant. for receive.

Cross-posted to: rec.radio.amateur.space,rec.radio.info

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

I have just arrived at this newsgroup, having been referred here from the GPS newsgroup "sci.geo.satellite-nav." Can someone fill me in on the details of this proposed group-buy of $150 GPS receivers?

Are the units hand-held or plug-in boards? Assembled? What model?

Thank you.

394. Re: Antennas

Newsgroup: rec.radio.amateur.space
Date: 1994-03-17 13:49:23 UTC
From: mallick@crd.ge.com
Message-ID: <CMtAEB.4Lx@crdnns.crd.ge.com>
Source record: 27998

I have the Hy-Gain "Oscar-Link" antenna array and it seemed to work quite well for me. I made a couple of contacts through AO-13 with my Ten-Tec 2510B running barefoot (10 Watts out). No problem hearing the bird either. I can't say too much about durability, since I took the antennas off of their temporary "armstrong" mount at the end of the summer. Hope to have a permanent setup soon.

Sorry the line limit got me on the message upload. Here is the rest of
the AMSAT format weather satellite keps .....

Satellite: MET-3/4
Catalog number: 21232
Epoch time: 94071.87651682
Element set: 679
Inclination: 82.5362 deg
RA of node: 237.6665 deg
Eccentricity: 0.0014715
Arg of perigee: 65.8899 deg
Mean anomaly: 294.3776 deg
Mean motion: 13.16460820 rev/day
Decay rate: 5.1e-07 rev/day^2
Epoch rev: 13868
Checksum: 339

Satellite: NOAA-12
Catalog number: 21263
Epoch time: 94074.00396538
Element set: 964
Inclination: 98.6278 deg
RA of node: 103.8182 deg
Eccentricity: 0.0013418
Arg of perigee: 145.8585 deg
Mean anomaly: 214.3456 deg
Mean motion: 14.22379795 rev/day
Decay rate: 1.80e-06 rev/day^2
Epoch rev: 14714
Checksum: 320

Satellite: MET-3/5
Catalog number: 21655
Epoch time: 94076.19735930
Element set: 687
Inclination: 82.5556 deg
RA of node: 181.6999 deg
Eccentricity: 0.0014730
Arg of perigee: 67.7742 deg
Mean anomaly: 292.4937 deg
Mean motion: 13.16828055 rev/day
Decay rate: 5.1e-07 rev/day^2
Epoch rev: 12435
Checksum: 340

```
Satellite: MET-2/21
Catalog number: 22782
Epoch time: 94072.07378319
Element set: 281
Inclination: 82.5479 deg
RA of node: 282.6058 deg
Eccentricity: 0.0022877
Arg of perigee: 131.3043 deg
Mean anomaly: 229.0093 deg
Mean motion: 13.83002641 rev/day
Decay rate: 4.4e-07 rev/day^2
Epoch rev: 2680
Checksum: 292

SpaceNews
=========

MONDAY MARCH 21, 1994

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It is published every week and is made available for unlimited distribution.

* SAREX FACT SHEET - STS-59 *
============================
WHO: Space Shuttle Endeavour crew

WHAT: Talk via Amateur Radio with students on earth.

WHERE: Earth Orbit. 57 degrees inclination. Altitude 220 kilometers.

WHEN: April 7, 1994 (9 day mission)

WHY: As part of the Shuttle Amateur Radio EXperiment (SAREX) component of the STS-59 mission.

LAUNCH: Scheduled for April 7, 1994 at 1207 UTC from the Kennedy Space Center, Cape Canaveral, Florida.

AMATEUR RADIO
LICENSED CREW
MEMBERS: Dr. Jay Apt, N5QWL, Mission Specialist
Dr. Linda Godwin, N5RAX, Payload Commander

PAYLOAD: Primary Payload--Shuttle Radar Laboratory 1 (SRL-1). Apt is the commander of the Blue Shift and will operate the shuttle systems during the "night" shift, while Godwin is responsible for overall operation of three large radars in the shuttle's cargo bay during the "day" shift.

Secondary Payload--Shuttle Amateur Radio EXperiment or SAREX, configuration C.

SPONSORS: The American Radio Relay League (ARRL), The Radio Amateur Satellite Corporation (AMSAT) and The National Aeronautics and Space Administration (NASA). SAREX is supported by the Federal Communications Commission (FCC).

SAREX RADIO
FREQUENCIES:Voice Downlink: (Worldwide) 145.55 MHz [Receive Only]
Voice Uplink: 144.91, 144.93, 144.95, 144.97,
144.99 MHz
Voice Uplink: (Europe only) 144.70, 144.75,
144.80 MHz
Packet Downlink: 145.55 MHz
Packet Uplink: 144.49 MHz

HAM RADIO FM Voice: call signs N5RAX and N5QWL
CALL SIGNS: FM Packet: call sign W5RRR-1

QSL VIA: Send reports and QSLs to ARRL EAD, STS-59 QSL, 225 Main Street, Newington, CT 06111, USA. Include the following information in your QSL or report: STS-59, date, time in UTC, frequency and mode (FM voice or packet). In addition, you must also include an SASE using a large, business-sized envelope if you wish to receive a card. The Orange Park Amateur Radio Club in Florida has generously volunteered to manage the cards for this mission.

INFORMATION:Goddard Amateur Radio Club (Greenbelt, MD) Amateur Radio station (call sign WA3NAN) news and retransmissions on Amateur Radio high frequency (HF) bands at 3.86, 7.185, 14.295, 21.395, and 28.65 megahertz (MHz) and on very high frequency (VHF) bands at 147.45 MHz.

Johnson Space Center Amateur Radio Club (Houston, TX) Amateur Radio station (call sign W5RRR) news bulletins on HF bands at 3.850, 7.227, 14.280, 21.350, and 28.400 MHz and VHF at 146.64 MHz.

ARRL (Newington, CT) Amateur Radio station (call sign W1AW) news bulletins (9:45 PM, 12:45 AM EST) on HF bands at 3.99, 7.29, 14.29, 18.16, 21.39, 28.59 and VHF at 147.555 MHz.

SHUTTLE
TRACKING: Current Keplerian elements to track the Shuttle are available from the NASA Spacelink computer information system BBS (205) 895-0028 and the ARRL BBS (203) 666-0578.

FOR FURTHER
INFORMATION:Tracy Bedlack, N1QDO, Educational Activities Department, American Radio Relay League 203-666-1541 email: ead@arrl.org

SAREX configuration C consists of the handheld transceiver, I/F module, PGSC, spare battery set, window antenna, packet module, SAREX headset assembly, personal recorder, and the required cable assemblies. The packet] module contains a power supply and packet TNC. The power supply provides power for the TNC and the handheld transceiver. The TNC interconnects with a radio transceiver so that data to and from the computer is transmitted to and received from other amateur radio stations.

Configuration C is capable of operating in either the voice or data mode in communications with amateur stations within LOS of the Orbiter. This

configuration can be operated in the attended mode for voice communication
and either the attended or automatic mode for data communications.

The payload control weights are as follows:
Configuration C 45 lb (20.41 kg)

STS-59 Keplerian elements for a 1207 UTC launch:

[Info via the ARRL]

* FO-20 SCHEDULE *
==================
The FO-20 command station announced that FO-20 will be placed in Mode JA
(Analog transponder mode) during Field Day 1994 (25-Jun-94 18:00 UTC through
26-Jun-94 18:00 UTC).

The current operating schedule is as follows:

Analog mode:
23-Mar-94 07:52 -to- 30-Mar-94 08:15 UTC

Digital mode: Unless otherwise noted above.

[Info via Kazu Sakamoto, JJ1WTK]

409. Shuttle Reentry Visible I

Newsgroup: rec.radio.amateur.space
Date: 1994-03-19 03:33:00 UTC
From: Jim.Rose@f239.n109.z1.fidonet.org
Message-ID: <249_9403190001@blkcat.fidonet.org>
Source record: 27663

GA>Unfortunately, that would take place at 1421 UTC (6:21 AM PST), about 5
GA>minutes after local sunrise. Gil has seen the reentry before after
GA>sunrise from Houston and says it should still be very visible as an
GA>orange fireball with a white streak behind it.

Gary,
Several years ago I had the opportunity to spot the shuttle as it
re-entered. I was sitting quietly watching NASA Select on the cable and
realized that the ground track and altitude they were showing might just
give me a viewing opportinity. This was in near full daylight. I ran
to the back of the house and figured out the geography, looked in that
direction and sure enough *there it was!*. Just like your friend
described it. As I write this, the shuttle landed this morning so I
hope you got a chance to see it. In the future, don't give up because
of the time of day, it's possible!

Also, thanks for the posts of the Keps/TLEs. I have sent an e-mail via
my internet account at work to subscribe. I hope I got the syntax
correct.

Jim

In Article <9403200930.AA13571@emh.yokota.af.mil>
watersk@emh.yokota.af.MIL (Ken Waters) writes:

>Hello, I would like to find a FAQ on packet satellite communications. Does
>anyone know if such a thing exists? I found a FAQ on packet radio but not
>pacsat. I would like to begin working it but need to know the basics
>including the equipment needed. Thanks.

I just found such a FAQ in 4 parts, posted in the last week or so to
the AX.25 packet network here in the US by KD2BD. As is so often the case
with multi-part posts to the ham BBS network only 2 parts made it to my
local BBS. I wrote to KD2BD and I am hoping he will either post it here or
put it on an ftp site.

Sat FAQ Answers

This was downloaded from local BBSs in Massachusetts. The author (or editor) seems to be stephen@mail.boi.hp.com. The article was posted by KD2BD@N2KZH.NJ.USA.NA to SPACE@AMSAT in four parts.

The following text was compiled from the following sources:

* "How to use the EZSATS pas tables by N9LTD" reprinted without permission. Full text, tables, and lots of other useful information can be obtained by sending a SASE to David Mullenix N9LTD, 2052 Brentwood Pky, Madison, WI 53704

* "Amateur Radio Satellite Frequencies" This file can be obtained from the ARRL e-mail server. For information on the server, send an e-mail message to info-serv@arrl.org with 'HELP' in body of message.

* "Summary - Getting onto the Hamsats" This was an article posted to rec.radio.amateur.misc newsgroup by Stephan Greene (sgreene@access.digex.com) on 20 Mar 1992. The article is also available via anon ftp from ftp.cs.buffalo.edu or Australian mirror at grivel.une.edu.au as file pub/hamradio/ham_sat_sum.

* "An Amatuer Satellite Operation Upgrade Path" from the AMSAT Journal, September/October 1993, pp. 24-26.

FORWARD:

Having recently started to get into Satellites, I asked MANY people what it took to get started and what to do. I found few people who could offer all the information necessary to start. I have attempted to compile this information for future newbies. If I have missed something, please ask and I will attempt to add it to the collection.

Also, if you really want to get serious about satellites, I would STRONGLY recommend joining AMSAT to help promote the satellite hobby. AMSAT is a volunteer organization that works for the interests of amateur satellites. Dues are only US $30 per year and you will receive a subscription to "The AMSAT Journal". For US $80, you will receive first year dues and a copy of Instant Track computer tracking software which is a top-notch program. Instant Track was donated to AMSAT by its author and its sales account for a considerable portion of AMSAT's income. AMSAT-NA, 850 Sligo Avenue, Silver Spring, MD 20910-4703. (301) 589-6062. Credit cards welcome.
NOTE: I am in no way connected with AMSAT-NA, other than I have found their publications quite useful.

MODES:

The combination of uplink freq, downlink freq, and transmission mode are all lumped together into standardized satellite MODES. Here is a list of common satellite modes used by satellites covered by this article:

A - This mode requires a 2 meter SSB/CW trasmitter and a 10 meter SSB/CW receiver and supports CW and voice.

B - This mode requires a 70 cm SSB/CW transmitter and a 2 meter SSB/CW receiver and supports CW and voice. Some satellites also support RTTY and SSTV in this mode.

K - This mode requires a 15 meter SSB/CW tra
nsmitter and a 10 meter SSB/CW
receiver and supports CW and voice. This mode is unique in that it can be done with a simple HF rig.

JA- This mode stands for J Analog and requires a 2 meter SSB/CW transmitter and a 70 cm SSB/CW receiver and supports CW, voice.

JD- This mode stands for J Digital and requires a 2 meter FM transmitter and and a 70 cm SSB/CW receiver and supports packet.

S - This mode requires a 70 cm SSB/CW transmitter and a 2.4 GHz SSB/CW receiver and supports CW and voice. Many people use a 2.4 GHz to 2 meter converter with a 2 meter SSB/CW receiver instead of buying a 2.4 GHz SSB/CW receiver.

Also, satellites have 3 basic types of retransmissions: beacon, transponder, and repeater.

Beacon - Most satellites have a fixed Morse beacon at the lower end of the satellites band-pass transponder. This is useful to detect when the satellite has crossed the horizon and is in range for operation. It can also be used to determine dopler shifts.

Transponder - A transponder is a band-pass repeater. It accepts a range of frequencies on the input and retransmits the entire range on the output. All offsets withing that range are preserved. NOTE: since the satellite is transmitting many signals at the same time, it is dividing its output power amongst all of these signals. If someone transmits a very powerful signal into the satellite, it will spend most of its power retransmitting that signal and all of the other signals will drop in power. This is NOT a way to earn friends and people who overpower the satellites input are called "alligators" and are not very popular.

Repeater - This closely resembles a land-based repeater. It listens for signals on one frequency and retransmits it on another frequency. All satellite repeaters (and transponders) are full duplex, meaning you can (and should) listen to your signal on the downlink (with headphones) while you are transmitting.

SATELLITES:

Some satellites are easier to work than others. The satellites that follow can be operated fairly easily and are referred to by some as the Easy Sats.

What follows is a breif description of each satellite. A summary list of operating frequencies is included later.

Mir

Mir (promounced "mere" - "Peace" in Russian) is the Russian Space Station. It's been in orbit since 1986. All recent Russian Cosmonauts have been hams and have callsigns with "MIR" in them, such as U2MIR. Mir has 2-meter equipment on board and they operate packet and voice on 145.55 MHz. (This is the same freq as the Space Shuttles.) The cosmonauts also have a digital voice recorder which can repeatedly transmit voice announcements.

The best way to get a QSL card from Mir is to connect to their TNC's mailbox, R0MIR-2, (That's R Zero MIR) leave a message AND GET A MESSAGE NUMBER. You must have the message number to qualify for a QSL. The TNC is often busy because amateurs forget to disconnect before Mir goes under their horizon. . . . . Press return for more, anything else + return to abort . . . .

In a case like this, try connecting to yourself or a friend VIA R0MIR. And if you hear a heavily accented voice calling CQ, by all means say hello!

70 cm and ATV gear is being prepared for future flights!

QSL Address:
Sergei Samburov (RV3DR)
Prospect Kosmonavtov. d.36, kw.96
Kaliningrad City, MOSCOW 141070, RUSSIA.

Sergei can also be reached via packet radio as RV3DR @ RK3KP.#MSK.RUS.EU

A special note on calculating Mir's orbit: Mir is big and it's in a low orbit. This means that there's a lot of atmospheric drag and it has to fire its rockets every month or two to boost itself back up or it would have re-entered and burned up long ago. Unfortunately, whenever this happens, it throws off all pass predictions. When this happens, Mir will arrive LATER than predicted, so if you tune to 145.55 and nothing happens at the predicted time, keep waiting, it may be along in 10-30 minutes.

SEEING MIR: Mir is also the only EZSAT that can bee seen. Mir is very big, about the size of a semi-trailer, and when it comes over just after sunset or just before sunrise, you can often see it go by. This is because Mir will still be in sunlight while you're in the earth's shadow. In these cases, Mir looks like a very bright star gliding acress the sky. It's a beautiful sight and well worth looking for. It's best to use a tracking program set to VISUAL to find visible passes. The best such programs will even draw you a star map and show you Mir's path across it. Don't forget to tune to 145.55 when you see it. Also, don't forget to get on the local repeater and tell people when you spot it so that others can share in the fun.

[Subject : Sat FAQ Answers 2:4]

OSCAR-21, RS-10/11, RS-12/13

These three satellites are all in 600 mile high polar orbits, which carry them over the US six to eight times a day for 10-18 minutes at a time. They all have orbital periods of about 95 minutes and we typically get two sets of three or four passes spaced 95 minutes apart. The two sets of passes are spaced 12 hours apart and their passes come a little earlier each day because their orbits don't take quite exacly 95 minutes.

These satellites all have a coverage circle about 4000 miles in diameter, so when they're about the horizon, you can use them to work hams anywhere in the continental US, Canada, Alaska, Mexico, Central America, South America down to the Equator, the Caribbean, Greenland, Iceland and parts of Scandinavia. Eastern hams can work Europe and the West can work Hawaii.

All of these satellites are in boxes that are bolted to larger Russian satellites and draw their power from the large satellite's solar cells. They are VERY easy to hear and fairly simple to work.

OSCAR-21

My favorite satellite. This is a German/Russian radio that uses a Digital Signal Processor (DSP) chip and it is Flexible with a capital "F"! It was launched in January, 1990 configured as a linear translator which received a band of 70 cm CW and SSB signals and relayed them on 2 meters. The bird was, to put it mildly, under-utilized. Then in 1992 the DSP chip was reprogrammed in orbit into a cross band FM repeater! If you've been wondering if DSP is as powerful as you've heard, now you know! In the past year, it's telemetry has been re-programmed from an obscure format to standard 1200 baud packet. WEFAX pictures (which are uploaded by teh ground controllers) were added in December 1993. (This is the same format used by many weather sats and short wave weather stations.)

OSCAR-21 has an input frequency of 435.016 MHz, but 435.015 works just fine. It's output frequency is 145.987 MHz, but 145.985 or 145.990 will receive it quite well. It has a strong transmitter and a ground plane antenna and most HTs have no trouble picking its signals up when it passes over. Mobiles and base stations with omni antennas will receive it full quieting. You can get into this bird with 20 watts and a six element beam antenna. I mount my beam on a photo tripod next to my car and run coax to my dual band mobile. You have to point the beam accurately, so I take a list of altitude and azimuth bearing generated by simple tracking software out with me and re-point the beam once a minute. In one summer, I worked the east and west coasts, several Canadians, Texas and Guantanamo Bay, Cuba before fall's cold weather drove me indoors.

Some OSCAR-21 tips: you can hardly get a word in edgewise during "prime time" opening passes. Try the late night passes instead, they're much less crowded. OSCAR-21's transmit and receive polarity rotate constantly during a pass. Mount your beam so you can easily rotate it for the best signal. Remember, all these ham sats are full duplex, so you can and should monitor your signal on the downlink. (Use headphones.) Turn the beam for minimum noise. You'll probably have to modify your dual band rig to get it to transmit on 435.015. BE CAREFUL because FM is generally NOT appreciated below 440 MHz. Also, the mod may allow you to transmit out of band, which is

a real no-no.

OSCAR-21 is also known as RS-14, AO-21 and Rudak-2. It's bolted to a satellite called INFORMATOR-1, which is often abbreviated INFORMTR-1. It's NORAD ID number is 21087. Be careful, the rocket booster that launched the satellite is still up there and it's named INFORMTR-1 R/B in some element sets. Your tracking program may find it instead of the satellite if you're not careful.

RS-10/11

This is probably the easiest satellite to work of them all. It has an incredibly sensitive receiver that can pick up the faintest two meter signal and relay it on ten meters. There are documented examples of people having QSOs on RS-10/11 by clicking Morse on HTs with rubber duck antennas! I guarantee you that your HT can put a useable signal into RS-10/11, I've done it myself. WARNING: if you try this, disable the microphone so you don't transmit any FM sidebands and turn your CTCSS (PL) OFF!

RS-10/11 (Radio Sputnik) is for CW and SSB signals, so an all mode 2 meter rig is ideal for transmitting to this bird. The input bandpass is from 145.860 - 145.900 and the output freqs are from 29.360 - 29.400 MHz. There is also a morse beacon at 29.357 MHz.

RS-12/13

A cousin to RS-10/11, RS-12/13 is also a 40 KHz wide linear transponder. However, this bird is unique because its input frequencies are in the fifteen meter band! This is also the only ham sat in the sky that requires more than a code free technician license to work it, because its input band is from 21.210 - 21.250 MHz. This straddles the Advanced and Extra portions of the 15 meter band. Its output freqs are from 29.410 - 29.450 MHz. Because of skip, this satellite can often be heard and worked when it's below the horizon! At least one person has earned DXCC on this satellite! RS-12/13 is bolted to the ?????? ???? satellite and its NORAD ID is 21089.

DOVE

DOVE is a transmit-only hamsat. It has no user accessible receiver. Built in Argentina, DOVE was launched in 1990 as a goodwill satellite. It was originally intended to transmit digitized voice messages that could be picked up by students with simple receivers. Unfortunately, the digital voice hardware and software has been a constant source of problems since launch. Atempts to get DOVE to works properly are proceeding as this is written, so the best bet is to tune your 2-meter rig or scanner to 145.825 MHz and see what the bird is up to currently. Be ready for Morse, standard 1200 baud packet or (with luck) digitized voice messages. The signals are strong enough so that an HT with a rubber duck will hear it when it's overhead, although ground plane antennas will give better coverage when the bird is near the horizon.

ANTENNAS:

For AO-13, the consensus is get to get KLMs, Telex/Hy-Gains, or roll-your own, Nobody liked the Cushcraft satellite antennas - they appear to have problems in wet weather. Bigger is also better, if you have the space. Several people mentioned the KLM 22C and 40CX pair as excellent performers (again - you need the room for those long booms!) KE4ZV stated his pair of KLMs (the big ones!) lets him work AO-13 with 3 to 30 watts (hardline feed and rigorous attention to routing the feedlines and cables properly to maintain the antenna patterns helps, too.). Others mentioned the KLM 14C/18C pair as good performers - but you need more power on the uplink.

Telex/Hy-Gain antennas were recommended by several people as a less expensive alternative to KLMs that work almost as well. There's also M2 (started by an engineer from KLM). While no one who responded uses them, the information I received from a call to their factory in California suggests they are comparable to slightly better than the KLMs in performance, and about the same in cost. Dave, WB6LFC, said homebrewing antennas is also feasible - it takes work, but attention to detail results in top-notch performance for very little money. Finally, Ross, VE6PDQ, reported good results using a pair of Cushcraft 215WBs on receive.

Problems encountered with AO-13 antennas include routing cables and feedlines off the back of the antennas (to preserve antenna patterns), use of fiberglass cross booms, mounting preamps as close to the feedpoint as possible, and long antenna booms drooping. (Gary, KE4ZV, recommends using a rope to brace the boom or stiffening booms and fiberglass masts internally with foam-in-a-can insulation.)

On antenna rotators, it appears the Alliance UD-100 is no longer made, though it should still show up at hamfests. People with long-boom antennas report the Alliance rotator is too weak to move a big array anyway, and recommended Yaesu's elevation-only rotator or their Model 5400 azimuth-elevation unit.

Antennas for the low-altitude satellites appear to be much less critical. J-poles were most frequently mentioned (the design from the AMSAT Journal?), but dipoles, ground-planes, and yagis are also in use. Several people work RS-10 quite well with antennas in the attic. Best results are with steerable antennas, but the high operator workload during a pass (unless the satellite is just grazing your access circle) almost demands computer control of the rotators.

[Subject : Satellite FAQ Answers 3:4]

PREAMPS:

You need a preamp for AO-13. (I can hear the downlink after a fashion on a Ringo fed with cheap coax and a 10 dB preamp in the shack, but it's not communications quality reception!) Only two people mentioned a specific brand name (Advanced Receiver Research and the unit included with the Ten-Tec 2510), so I assume almost any GaAsFET preamp in the 20dB gain class is adequate. THE PREAMP MUST (almost always) BE MOUNTED AT THE ANTENNA (check the discussion in Chapter 9 of the Satellite Experimenter's Handbook and you'll see why!). KE4ZV recommends mounting the preamp AT the antenna

feedpoint, if your elevation rotator can handle the unbalanced load.

While no one mentioned it (maybe it's obvious), if the antenna is used to transmit (say Mode J) as well as receive (on Mode B, for example), the preamp MUST either include RF-sensed switching, or be switched out of the line before you transmit. TRANSMITTING INTO AN UNPROTECTED PREAMP WILL DESTROY IT INSTANTLY!

Preamps also seem to help on RS-10 (especially with older HF rigs) and on the Pacsats. It seems to be a case of "try it, and get a preamp if it looks like it would help").

RIGS:

Three radios were mentioned by name - Yaesu FT736 (and it's predecessor, the 726 with satellite module), Kenwood TR751 (a mobile-capable 2 meter multimode), and Ten-Tec's 2510. The Ten-Tec unit is out of production. The few units left are selling for about $300-350. I'm sure other multi-mode radios, and setups with converters and transverters work well, too - it's just that no one mentioned any by name.

Power output required is a function of the satellite, your antennas, and how badly you want to communicate. [QRP on the satellites is just like QRP on HF - you need good antennas and feedline, you have to pick optimal passes, and skilled operators at both ends are needed. Given the apparent "calmer" operating style on AO-13, QRP is probably easier there than on 20 meters!]

Anyway -about power for AO-13. 3-30 watts will work if you have top-notch antennas (KE4ZV). KC7IT uses 50-100 watts (Ten Tec 2510, Mirage D1010 amplifier, KLM 14C/18C fed with 50 feet of 9913). Both KE4ZV and KC7IT use Mirage D1010 amplifiers on 70 cm when they need a little extra power. For an "optimum station", WA5ZIB recommends 60 watts on 70 cm and 80 watts on 2 meters for AO-13, assuming good antennas (Telex/Hy-Gain or better) and feedlines, and 20 watts to a 5' dish for Mode L. Andy emphasized that you can get by and have lots of fun with much less!

For Mode A, WA5ZIB said 6 watts to the AO-13 2 meter antenna will work well. People using omnis report success with the Pacsats running 50-70 watts to a J-Pole (N5VGC). Several people said they (or someone they know) have no trouble using RS-10 at lower power (10-25 watts) with simple, omnidirectional antennas. Again, it's a case of "try it and see if it works."

There was unanimous consensus that the receiving equipment (antenna, preamp, feedline, and receiver) is more important than the transmit equipment. Running more power "to hear yourself" is frowned upon, to say the least! It's also important to be able to vary uplink power to adjust to specific conditions. Both the Ten Tec 2510 and the Yaesu 736 have continuously variable power output (I guess the rest of us just have to fiddle with the drive controls on our rigs!).

ACCESSORIES AND OTHER STUFF:

You need a PSK modem to use the Pacsats. PacCom makes fully assembled units, either already integrated with their own TNC, or as a board you install in your TNC-2 clone. They make similar 9600 bps units for accessing UO-22. The downlink receiver (on 70 cm) should be capable of being tuned by the PSK modem's AFC lines. Newer radios can use the up/down lines from the microphone jack or an accessory connection on the rear panel. Older radios must be modified, or be tuned manually. N5VGC told me he sees about 20KHz of doppler on an AO-16 pass, and that without automatic tuning, operator workload is too high to do much else besides tune the receiver!

Just about any radio suitable for packet on 2 meters will work for AO-16, WO18, and LU-19. To run 9600 bps on UO-22, modifications to bypass the microphone and speaker's audio processing circuits are required. I've seen some reports on rec.radio.packet and in the various Hamsat columns that differences between UO14 and UO-22's transmitters make UO-22 more difficult to copy. (I'll worry about that problem later - I'll start with AO-16 and LU-19 first!)

No one mentioned computers - again, it must be obvious (also, we're "talking" using computers!). They're handy, and you need one IN THE SHACK when working the Pacsats or for automated, real-time control of antenna rotators (useful for low altitude satellites).

Other operator aids mentioned, or I thought of on my own: If your radio can't slave uplink and downlink tuning (Ten Tec 2510 and Yaesu 736 can), you need something to help convert between uplink and downlink frequencies (and account for doppler shift and calibration errors on the radios' frequency readouts). A cardboard slide scale or dial will work. I'm thinking of programming my HP48 to do the conversion for me. You need something like this to know where to tune on the uplink to hear a given downlink frequency.

Software to track satellites and predict passes. There are many programs that work. Price ranges from free to $70 for state-of-the-art QuickTrack or InstantTrack (available from AMSAT). Special software is also needed to use the Pacsats, and to interpret telemetry data. This software is also available from the usual ham sources, and from AMSAT (BTW, software sales support the amateur satellite program!)

Polarity switchers optimize antenna performance by allowing switching antenna feeds from RHCP to LHCP as the need arises. They are a very useful add-on, but don't appear essential.

Equipment to measure power output, SWR, transmit frequency - all useful (see - satellites are not that different from HF!).

I was able to find the missing parts on another BBS and I have posted it to
this group as Sat FAQ Answers, the title under which it was posted to the
BBS network.

I presume that further posting is OK with the original authors. What I
posted seems to be a composite of several different articles and it isn't
clear who wrote what or who edited the composite document.

Hello, I would like to find a FAQ on packet satellite communications. Does anyone know if such a thing exists? I found a FAQ on packet radio but not pacsat. I would like to begin working it but need to know the basics including the equipment needed. Thanks.

>Ken/N4PBY

On or about Feb 28th, Stephen Holmstead (stephen@hpdmlge.boi.hp.com) posted
a fairly comprehensive amateur radio in space FAQ. I wrote him a while
back and made some suggestions, particularly in regard to making it
available via several FTP archives that would be glad to have it, but
haven't heard anything from him since.

Perhaps if you dropped him a line, and asked nicely, he would send you a
copy.

BID: $ANS-078.01

AMSAT PHASE 3-D INTERNATIONAL SATELLITE BUILDERS MEET IN
MARBURG--PROPELLANT TANKS DELIVERED

During the week of February 10-16, 1994, Dr. Karl Meinzer, DJ4ZC, AMSAT-DL President and Project Leader for the International AMSAT Phase-3D satellite, and Werner Haas, DJ5KQ, Vice-President of AMSAT-DL hosted a working meeting in Marburg, Germany to discuss recent progress on the project. Agenda items centered primarily around the spacecraft's electronic systems including the on-board computer (IHU) and RUDAK systems, as well as the progress now being made by team members on the spacecraft's other electronic modules.

Also during the meeting, the team took delivery of P3-D's main propellant tanks. The tanks were manufactured in Russia under contract from AMSAT-DL and in accordance with AMSAT specifications. Seven tanks were delivered, although one had been subjected to a destructive pressure test by its Russian manufacturer.

Not only have all the propellant tank specifications been fully achieved, but they've actually been significantly surpassed. Each tank can accommodate almost 50 liters of propellant. Favorable conditions for the purchase and delivery of these tanks was arranged through the efforts of AMSAT-UA (Russia). Following a brief inspection, the tanks were immediately shipped to Orlando, Florida, where integration of the satellite is now slated to begin this summer.

Dick Jansson, WD4FAB, AMSAT-NA Vice-President for Engineering, also attended the meeting, principally to discuss various aspects of the satellite's structure with Dr. Meinzer and Konrad Mueller, DG7FDQ. He reported on the good progress of the flight model structure's construc-tion, currently underway at Weber State University in Utah.

Also in attendance were Lyle Johnson, WA7GXD, Peter Guelzow, DB2OS, and Gerhard Metz, DG2CV. Lyle is known through his work with the Tucson Amateur Packet Radio (TAPR) group (which he co-founded) as well as for his work on the Microsats and on the P3-D GPS project. After much discussion, the team decided to again employ a cable wiring harness

arrangement for Phase 3-D, similar to that used on AO-10 and AO-13, rather than an AART-based LAN design. However, the team decided to also fly a CAN bus and DB2OS's experimental LAN controller as part of the spacecraft's digital (RUDAK) transponder.

In a related decision, the group concluded that the AO-10/AO-13 1802-based Internal Housekeeping Unit (IHU) computer design would still be adequate for P3-D with some minor modifications. Lyle Johnson announced his willingness to redesign the IHU and to construct a flight unit. His offer was greatfully accepted.

Other meeting items centered on P3-D's RUDAK work now being done by Peter Guelzow, Gerhard Metz, and Dr. Stefan Eckart, DL2MDL. This team has now decided to build two RUDAKs. The first will be a user-oriented digital communications module constructed by Lyle Johnson, in close cooperation with Peter Guelzow. This RUDAK, which has yet to be formally named, will be the one most P3-D satellite users will operate. A second, more experimental RUDAK (called RUDAK-E), will be built in Germany. It will promote experiments with advanced high speed modems, Digital Signal Processing (DSP) techniques, and new communications protocols.

In a host of other issues, Daniel Orban, ON4AOD, discussed details of the 24 GHz transmitter. Konrad Hupfer, DJ1EE, reported his progress in building the 250 watt U-Band (70 cm) final amplifier. Werner Haas displayed his first flight hardware consisting of two command receivers, a digital section, and the 70 cm exciter that will drive Konrad's 70 cm final amplifier. Freddy de Guchteneirie, ON6UG, reported his progress on the construction of dual V-Band and U-Band receiver "front-ends". Dr. Matjaz Vidmar, S51MV, reported he has now begun construction of the HF-Band, C-Band and S-Band receivers. He expects to deliver working prototypes in May.

While much work still remains to be done, Dr. Meinzer expressed his approval and sincere thanks to all participants for their superb work and close cooperation on this vitally important AMSAT international project. A complete text of this meeting's minutes has been prepared by Peter Guelzow, and has since been translated by Don Moe, DJ0HC/KE6MN. The text will be made available to the various international AMSAT Journals for possible inclusion in their upcoming editions.

[The AMSAT News Service (ANS) would like to thank Peter Guelzow, DB2OS, Don Moe, DJ0HC/KE6MN, Lyle Johnson, WA7GXD, and Keith Baker, KB1SF, for their assistance in writing, translating, and formatting the information contained in this bulletin item.]

ITAMSAT-OSCAR-26 (IO-26) Ground Team Discovers Problem

Starting last week the PSK modulation on the primary trasmitter became more and more difficult to decode. A residual carrier and lower output power seem to indicate a failure in the PSK balanced modulator, being worse at the current low power setting. Increasing the power level makes the de-modulation better but is not accetable due to power budget constraints. Ground controllers decided to switch to the secondary PSK trasmitter on 435.822 MHz. The first two passes over Italy confirmed the correct operation of the spacecraft and WOD are being taken to analize the per-formance of the satellite in this new configuration. BBS is working as usual and status bulletin will be uploaded in the next few days.

AO-13 OPERATIONS NET SCHEDS

HR AMSAT NEWS SERVICE BULLETIN 078.03 FROM AMSAT HQ
SILVER SPRING, MD MARCH 19, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-078.03

Current AMSAT Operations Net Schedule For AO-13

AMSAT Operations Nets are planned for the following times. Mode-B Nets are conducted on AO-13 on a downlink frequency of 145.950 MHz. If, at the start of the OPS Net, the frequency of 145.950 MHz is being used for a QSO, OPS Net enthusiasts are asked to move to the alternate frequency of 145.955 MHz.

Date UTC Mode Phs NCS Alt NCS

26-Mar-94 2130 B 084 WA5ZIB W5IU

Any stations with information on current events would be most welcomed. Also, those interested in discussing technical issues or who have questions about any particular aspect of OSCAR statellite operations, are encouraged to join the OPS Nets. If neither of the Net Control Stations show up, any participant is invited to act as the NCS.

AO-13 ZRO Tests For March 1994

The following schedule of Mode "B" tests were chosen for convenient operating times and favorable squint angles. The tests can be heard on 145.840 MHz. Andy McAlister (WA5ZIB) will conduct all the tests. Mode "JL" tests will no longer occur due to the failure of AO-13's 70CM trans-mitter.

Day Date (UTC) Time Areas covered

Saturday Mar. 26, 1994 2315 UTC NA, SA

Note that the dates and days are shown in "UTC". Any changes will be announced as soon as possible via the AMSAT HF and AO-13 Operations Nets.

All listener reports with date of test and numbers copied should be sent to Andy McAllister (WA5ZIB), AMSAT V.P. User Operations, 14714 Knights Way Drive, Houston, TX 77083-5640. A report will be returned verifying the level of accurate reception. An S.A.S.E. is appreciated but not required.

SSTV ON OSCAR 13

Slow scanners are invited to join the SSTV sessions on AO-13. The frequency is 145.955 MHz. The net meets at 45 minutes before Mode S, and on Mode B following Mode S on Saturdays and Sundays. Join those sessions or convey your wishes for other skeds to wb6llo@amsat.org, and he will coordinate your efforts.

Well, if such an FAQ is going to be posted, someone should take
responsibility for doing it (either the original author, or a proxy).
That way, it's clear who is accepting and merging in changes and
feedback. Also, a single poster has knowledge of when it was last
posted, and (hopefully) will post it on a regular schedule (not every
week, but not just once a year either).

Else we may have just a lot of chaos and arguments.

Opinions?

Hello All.
Sunday the 20th of March we put up an ground station
for AO-13 to show Amateur radio through satellites in
a open house of the Technical School of Reykjavik.
There is now a working amateur club in this school that
hopes to get fundings to buy a rotor and a FT-736R
and put up antenna s for satellite work.

Now we have up a station witch consists of:

FT-736R full-duplex all mode transceiver.
RFconcepts 30w in 100W out amlifier on 70cm.
ARR. preamplifier on 2m.
Yaesu G-5600 az/el Rotor.
Tonna 2x9 elements on 2m and 2x19 on 70cm.

All the equipment comes from TF3TXT and TF3BNT.
We are going to operate AO-13, AO-10, AO-21, AO-27,
from the 20th of march, and hopefully to friday the 25th.

After that I (TF3BNT) and TF3TXT are going to put up our
Mode-B gear and be active all summer, Allso look for TF8ITT,
Ps. We are going to be active on MODE-S later in the summer.
(we hope).
As soon as the weather conditions get better, We will put up
our gear and be ready for action. :-)

So I say 73 de TF3BNT

My adress is :

Benedikt Sveinsson TF3BNT
Hateigsveg 2

426. Two-Line Orbital Element Sets (TLE362)

Newsgroup: rec.radio.amateur.space
Date: 1994-03-22 00:44:04 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.764297044@afit.af.mil>
Source record: 27680

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.info.
This week's elements are provided below.

427. Any sat tracking progs available for unix?

Newsgroup: rec.radio.amateur.space
Date: 1994-03-22 12:52:03 UTC
From: robert@plasma.apana.org.au
Message-ID: <2mmplj$uj0@plasma.apana.org.au>
Source record: 27681

Does anyone know of a program preferably written in C (but fortran-77
would suffice I suppose) which will track satellites using the standard
2-line element sets. I would like to compile it up under UNIX. I see
absolutely no reason why these programs should only be available in
a pre-compiled form for mess-doss :-)

Thanks in advance.

428. Controling G-5600 az/el rotor with PC.

Newsgroup: rec.radio.amateur.space
Date: 1994-03-22 23:14:09 UTC
From: bnt@rhi.hi.is
Message-ID: <2mnu41$s3g@eldborg.rhi.hi.is>
Source record: 27682

Hello all.

I want to control my Yaesu G-5600B az/el rotor with my PC.
I know that I can buy the Kansas City Tracker for $200, but
I would rather like to spend less money on that and try to
get to Mode-S instead. I have been looking at the ORBITDRV,
that comes with Instant Track and I find it pretty nead.
I tryed to program a RotorDRV program insted of DUMMYKCT, But
OrbitDRV allways returns with RotorDRV not found. I'm looking
for the ASM sourche code for the DummyKct or similar driver.

So please if you can help me in my quest for cheap homemaid
computerized satellite tracking equipment (CHCSTE). Please
post or e-mail.

Designing and building the equipment is no problem, but to
have some TSR program to guide it is the problem, ps. Im ok
in programming in C and ASM, but I only need some information
how to communicate with OrbitDRV.

429. SatSked, TrakBox Beta Rom now on oak.oakland.edu

Newsgroup: rec.radio.amateur.space
Date: 1994-03-22 23:35:44 UTC
From: wroth@netcom.com
Message-ID: <wrothCn3AvM.7FJ@netcom.com>
Source record: 27683

I just uploaded two files to oak.oakland.edu. The first one is called SatSked. I wrote this program to automate a digital pacsat ground station. It requires a registration number from Amsat NA, UK or DL for operation. All proceeds go directly to the Phase IIID satellite launch funds in the respective organization.

The second file is the latest code for the Jamsat/Tapr TrakBox. It features inputs for mike clicks from a PSK modem to keep the doppler shift in check from PSK birds, along with a bunch of new features. Keep in mind this is a BETA release. Here are the two filenames:

pc/satellite/satsked.zip
pc/satellite/trk320a.zip

Good luck tracking!

Help!! I'm Looking for info on using meteors to bounce signals for telecommunication. I saw a show in January on it. Now I have to write a paper on something in telecommunication and as you can see my writing sucks. But I think if I can get some info about something my prof has not hear of it will help. So any one out there with info or know how I can get some please reply.

Notes
-----
1. NASA Catalog Number is also known as NORAD or U.S. Space Command object number.
2. No orbital plane position = satellite no longer operational.
3. Clock: Rb = Rubidium; Cs = Cesium
4. S/A had been enabled on Block II satellites during part of 1990; S/A off between about 10 August 1990 and 1 July 1991 due to Gulf crisis; standard level re-implemented on 15 November 1991. Currently, PRN15 and PRN20 appear to have little or no S/A imposed.
5. Anti-spoofing was activated on 94-01-31 at 0000 UT on all Block II satellites. (ref. NANU 050-94042)
6. PRN number of SVN32 was changed from 32 to 01 on 93-01-28.
7. PRN03 is operating on Rb clock without temperature control.
8. PRN03 was set unhealthy on 94-02-27 at 0320 UT. It was unusable beginning at 0233 UT on 94-02-27 and will remain unusable until further notice due to "end of life testing." (ref. NANU 057-94059 and NANU 083-94059). It is unlikely that PRN03 will return to service. (ref. USNO)
9. The decommissioning date for PRN06/SVN03 is the date of termination of operations of this satellite (ref. USNO) and is about 3 weeks later than the date GPSIC gives for "deactivation".
10. The PRN06/SVN36 launch included the SEDS-2 tether experiment on the Delta II rocket body (object 23028, 1994-016B).
11. PRN09 was unusable beginning 93-10-15 1200 UT until 93-12-07 1940 UT due to testing. (ref. NANU 327-93288 and NANU 402-93341)
12. The power supply of PRN13 may have insufficient capacity to maintain L1/L2 transmissions during eclipse season. During this period, the L1/L2 transmissions of PRN13 may be turned off for up to 12 hours a day. (ref. NANU 285-92315)
13. The degraded C/A-code performance of PRN19 was corrected effective 94-01-04 at 0000 UT. (ref. NANU 343-93294, NANU 396-93337, and NANU 006-94010)
14. PRN24 was unusable from 94-01-23 1745 UT until 94-02-01 1516 UT due to a change in operational frequency standard from Cs to Rb. (ref. NANU 023-94023, NANU 029-94024, NANU 034-94032, and USNO)

Amateur radio operators use this (sometimes). April "QST" magazine has a table of current record-holders using various "modes" of propogation for microwave communications and I think meteor-scatter is one of the ones shown. In any event, meteor-scatter should be covered in the "ARRL HANDBOOK", available in many bookstores (particularly University Bookstores at schools with significant technical orientation).
Other amateur radio magazines that you might look at are probably in your school library, and certainly in any large bookstores around there.

433. what does NO -2 N4USH mean?

Newsgroup: rec.radio.amateur.space
Date: 1994-03-24 23:36:27 UTC
From: bmm1@freenet2.scri.fsu.edu
Message-ID: <9403242326.AA24705@freenet3.scri.fsu.edu>
Source record: 27687

I am trying to establish an uplink to UO22 and so far have all I have gotten is the message 'NO -2 N4USH'. What does this mean? Does anyone have any info on what all the information that OSCARS 22, 23 & 25 routinely downlink means? Some is obvious, some is not. I have found some problems and corrected them and am waiting for evening passes to check them out. Any suggestions or comments on debugging uplinks would be appreciated.
thanks, Bruce. N4USH

> [Communication via meteors has] never taken off and as far as I can tell it
>'s only being used by experimenters.

I believe I read a few years ago about meteor scatter being used by remotely located unmanned weather stations to relay information to central locations using packet radio techniques. The information is bundled into packets that are small enough and transmitted rapidly enough that an entire packet has a good chance of getting through in its entirety. The packet protocol verifies receipt of packets and causes retransmission of unverified packets until they are successfully received. Since the total volume of information is relatively small the overall data rate is satisfactory.

My recollection is vague, but this could have been an article in the journal Science, and perhaps it was as long ago as the late '70s. I think I recall a color picture of a remote weather station in the arctic on the cover of the issue. I would be pleased if someone could find the reference and send it to me.

I wonder if hams have done work on meteor scatter packet transmission? It would have to be done on clear channels and with very specialized parameters (short packets, unlimited retries, fast response).

On a related topic, I have sometimes noticed when propagation is marginal but not entirely dead on 10 or 15 meters that weak signals will "pop up" briefly and then return to their normal level. I have suspected, but do not know for sure, that this is due to meteor trail reflections.

436. Two-Line Orbital Element Sets (TLE366)

Newsgroup: rec.radio.amateur.space
Date: 1994-03-26 16:11:16 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.764698276@afit.af.mil>
Source record: 27690

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.info.
This week's elements are provided below.

SB SAT @ AMSAT $ANS-085.01
WEEKLY OSCAR STATUS REPORTS

HR AMSAT NEWS SERVICE BULLETIN 085.05 FROM AMSAT HQ
SILVER SPRING, MD MARCH 26, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-085.01

Weekly OSCAR Status Reports: 26-MAR-94

AO-13: Current Transponder Operating Schedule:
M QST *** AO-13 TRANSPONDER SCHEDULE *** 1994 Mar 19-Apr 04
Mode-B : MA 0 to MA 90 |
Mode-BS : MA 90 to MA 120 |
Mode-S : MA 120 to MA 122 |<- S beacon only
Mode-S : MA 122 to MA 145 |<- S transponder; B trsp. is OFF
Mode-S : MA 145 to MA 150 |<- S beacon only
Mode-BS : MA 150 to MA 180 | Blon/Blat 180/0
Mode-B : MA 180 to MA 256 |
Omnis : MA 230 to MA 30 | Move to attitude 235/0, Apr 04 240/0, Apr 04
[G3RUH/DB2OS/VK5AGR]

FO-20: The following is the current schedule for transponder operations:
ANALOG MODE:
23-Mar-94 7:52 -to- 30-Mar-94 8:15 UTC
6-Apr-94 6:45 -to- 13-Apr-94 7:10 UTC
20-Apr-94 7:35 -to- 27-Apr-94 7:55 UTC
11-May-94 6:54 -to- 18-May-94 7:20 UTC
Digital mode: Unless otherwise noted above.
[Kazu Sakamoto (JJ1WTK) qga02014@niftyserve.or.jp]

MIR: The packet call for MIR is R0MIR-1 and the operating frequency is
145.550 MHz. The crew usually has the Personal Messaging System
(PMS) running. If you hear voice operations ask for Victor, Yuri, or
Valeri. [VK3DFI]

AO-27: AMRAD-OSCAR-27 (AO-27) is up and going, and is said to be working
well. It is in popular use in Europe. The 436.800 MHz FM down-
link can be heard on a hand-held. Uplink is 145.850 MHz. It is
said to be only active in daylight passes. [G3IOR]

UFO: We have a UFO on 145.592 MHz sending data. It was first heard by
G3JQI at 18:50 UTC "dopplering" down until 18:55 UTC LOS on
16-MAR-94. [G3IOR]

The AMSAT NEWS Service (ANS) is looking for volunteers to contribute weekly OSCAR status reports. If you have a favorite OSCAR which you work on a regular basis and would like to contribute to this bulletin, please send your observations to WD0HHU at his CompuServe address of 70524,2272, on INTERNET at wd0hhu@amsat.org, or to his local packet BBS in the Denver, CO area, WD0HHU @ W0LJF.#NECO.CO.USA.NOAM. Also, if you find that the current set of orbital elements are not generating the correct AOS/LOS times at your QTH, PLEASE INCLUDE THAT INFORMATION AS WELL. The information you provide will be of value to all OSCAR enthusiasts.

/EX

Some of the messages about meteor-burst type communication posted are not quite correct. I have done quite a bit of meteor-burst communication on two meters and one does not need 12 to 24 hours to complete a contact. An excellent starting point for information on amateur radio experimentation in "this area is the ARRL book called something like "Beyond Line of Sight". There are alot of articles about maximizing success during showers. I have had good results scheduling stations in the 900-1200 mile range. This pre-arrangement is usually done on 75 meters, 3818 and 3843, before and during the showers. I have made good two-way contacts in as little as one or two minutes, and have also heard nothing for an entire half hour of schedules. During any shower there is usually a peak when one can get on and call short CQ's and raise people, especially if one stays off 144.2. I have had about ten people call at once at times. This effect is also noticeable on 10, 15, 20 and 6 meters, anywhere where the signal is lower than the burst that it may recieve from the meteor enhancement. There is also some software available for predicting when the peaks in the showers will correspond to your qth, please e-mail me if you are interested.

I would like to use the ADC on the game port(joystick port) to digitize processed (ie filter and other needed things) APT output with my old humble 386.Any known pitfalls or no no's??

442. MIR hard to reach these days?

Newsgroup: rec.radio.amateur.space
Date: 1994-03-29 19:12:25 UTC
From: Greg <laborde@elm.jpl.nasa.gov>
Message-ID: <2n9uip$did@elroy.jpl.nasa.gov>
Source record: 27696

Is Mir's packet station on these days? I have been using InstanTrack and getting the latest Keps from archive.mil, but I have not had any response for about the last 10 days. One night I even went outside and caught a visual sighting, so I know that I am tracking it OK.

Another disturbing fact is that I don't see anyone ELSE trying for Mir. What do they know that I don't?

-Gregory LaBorde

Archive-name: radio/rec-radio-info/welcome
Last-modified: $Date: 1994/01/02 22:00 $
Version: $Revision: 1.06 $

*** Welcome to rec.radio.info! ***

Welcome to rec.radio.info, a group that aims to provide a noise-free source
of information and news for the entire rec.radio hierarchy.

Two introductory articles about rec.radio.info are posted to the group and
to news.answers every two weeks. You are now reading the first article, which
explains what rec.radio.info is, and answers some Frequently Asked Questions.
The second article is titled "Submission Guidelines", and you only need to
read it if you want to submit an article to rec.radio.info.

You can skip to the next section of this article by searching for the next
" -- " string. The sections available are:
- What is the purpose of rec.radio.info?
- Why are messages almost always cross posted to rec.radio.info?
- What is a 'follow-up', and what does 'moderated' mean?
- OK, so now I know what 'moderated' means. Tell me more.
- What type of material is considered inappropriate?
- I do not have access to news, how can I get the information posted to
rec.radio.info?
- Will the material appearing in rec.radio.info be archived somewhere?
- I have a regular posting with timely information, is there a way to
speed up it's delivery, or automate for more convenience?

-- What is the purpose of rec.radio.info?

The purpose or charter of rec.radio.info is to provide the Usenet community with
a resource for information, news, and facts about any and all things radio.

All the other rec.radio groups are intended for discussions and general chit
chat about radio. Rec.radio.info will contain informational, factual articles
only. Follow-ups are redirected to an appropriate other group, and further
discussion (if any) will not take place in rec.radio.info.

In order to ensure that rec.radio.info contains only appropriate articles, it
was decided to create the group as a moderated newsgroup.

-- Why are messages almost always cross posted to rec.radio.info?

It provides a "tag" for each article to be assembled into a filtered
presentation in rec.radio.info (even with cross-posting, only one message, with
```

a unique Message-ID, is propogated across the net). This tag also facilitates a pre-existing method of dropping or cancelling the articles locally within the discussion groups if you don't want to see them. This accommodates individuals who want to separate the bulletins from the discussions, discussions from the bulletins, as well as those who are adamant about not reading another newsgroup and wanted to see everything all in one basket.

With the total size of Usenet (in number of newsgroups and total traffic) doubling every year or so, this is no insignificant contribution to reducing information noise and chaos. Making the discussion groups a catch-all, and making extra newsgroups filters on that catch-all, is also the most realistic way to implement such a scheme (It's not intuitively obvious what the charter, contents, and general appropriate topics for each and every newsgroup are. Seeing FAQ's and charter/intro postings in the home newsgroup is beneficial for new readers).

By cross-posting one only is adding a few tens of bytes to each bulletin (to specify the extra group on the Newsgroups line), but are adding the capability for very powerful filtering features available on most news servers, listservers and readers. Your local news guru could probably explain these features in more detail.

In rn, for example, according to Leanne Phillips in her rn kill-file FAQ, add a line of the form:
/Newsgroups:.*[,]rec\.radio\.info/h:j
either in ~/News/KILL (if you don't want to see rec.radio.info articles anywhere) or ~/News/rec/radio/amateur/misc/KILL (if you don't want to see them just in rec.radio.amateur.misc). The latter method means your kill file will only be consulted during rec.radio.amateur.misc (and hence runs more efficiently), and will probably work for most people.

In nn, according to Bill Wohler in his nn FAQ, add a line of the form:
rec.radio.info:!s/:^
in ~/.nn/kill (if you don't want to see rec.radio.info articles anywhere), or put the following lines:
sequence
rec.radio.info
rec.radio.
at the end of ~/.nn/init in order to see all the rec.radio.info bulletins first, then read the remaining rec.radio.* without the bulletins.

-- What is a 'follow-up', and what does 'moderated' mean?

If you are new to Usenet and are not familiar with the terminology, you might want to read the general introductory articles found in the newsgroup news.announce.newusers. Doing so will make your life on the net much easier, and will probably save you from making silly beginner's mistakes.

If you think that at this moment you are reading an echo, a conference, or a bulletin board, I'd also strongly suggest a trip over to news.announce.newusers.

For the rest of this article, I will assume you have a basic knowledge of Usenet terminology and mechanics.

A moderated group means that any article that needs to be posted to the group has to be accepted by the moderator of the group. Since we need to ensure that followups to an article (discussion) do not show up in the rec.radio.info newsgroup, the `Followup-To:' header line contains a newsgroup that is appropriate for disussions about the specific article.

-- OK, so now I know what 'moderated' means. Tell me more.

Rec.radio.info is a moderated newsgroup, which means that all articles submitted to the group will have to be approved by the moderator first.

The current moderator of the group is Mark Salyzyn. Submissions to rec.radio.info can be posted, or e-mailed to:

rec-radio-info@ve6mgs.ampr.ab.ca

Comments, criticisms, suggestions or questions about the group can be e-mailed to:
rec-radio-request@ve6mgs.ampr.ab.ca

But before you do so, please be sure to check out the "Submission Guidelines" article.

The influence of the moderator should be minimal and of an administrative nature, consisting chiefly of weeding out obviously inappropriate articles, while making sure correct headers etc. are used for the appropriate ones.

-- What type of material is considered inappropriate?

There are three broad categories of articles which will be rejected by the moderator:

1) Requests for information: rec.radio.info is strictly a one-way street. I receive information in my mailbox; I then post it to rec.radio.info. Requests for specific information belong in the normal discussion newsgroups. If your request gets answered, you might consider passing the answer on to rec.radio.info, though. Especially if you can edit it into a informational, rather than a discussion, format.

2) Obvious discussion articles, or articles that appear unsubstantiated.

3) Commercial stuff: a relatively unbiased test of a radio product would be accepted, but any hint of for-profit might be reason for rejection. For three reasons: This is not the purpose of the list, for-profit is a controversial topic, and this list may be passed onto Amateur Packet Radio (where for-profit is prohibited except under certain provisos).

rec.radio.swap (or possibly comp.newprod) may be more deserving of the posting in any matter.

Similarly, copyrighted material generally cannot be used. If it's TRULY worthwhile to the net, I would recommend obtaining permission from the copyright holder. Please note the source, and if permission was given. I

reserve the right to make the final decision concerning appropriateness in all situations. In most cases, a brief summary of, or pointer to, the copyrighted information may be all I can allow.

-- I do not have access to news, how can I get the information posted to rec.radio.info?

brian@UCSD.EDU (Brian Kantor) has kindly supplied a mail list server for rec.radio.info. Non of the articles will be digested, due to their size, so you will receive individual mailings for every article posted to the group.

Mail sent to radio-info@ucsd.edu will be forwarded to the moderator and thus is an alias to rec-radio-info@ve6mgs.ampr.ab.ca

To subscribe and unsubscribe via the listserver; the format for that is

sub address radio-info
unsub address radio-info

where 'address' is your full mailing address. Send this request to

listserv@ucsd.edu

Note that the server will automatically delete any address that bounces mail. If you leave the address portion blank, it will try to deduce your address from the mail headers. This may not work if you are on bitnet, milnet or some other non-Unix host, so it is recommended to put your return address in any case. For example:

sub mymailbox@myhost.mydomain.mil radio-info
or
sub MEMEME01@DMBHST.bitnet radio-info

or something like that.

-- Will the material appearing in rec.radio.info be archived somewhere?

Yes. Still firming up details at the moment but here is a preliminary list:
- unbc.edu as maintained by Lyndon Nerenberg <lyndon@unbc.edu>
- nic.funet.fi maintained by Risto Kotalampi <rko@cs.tut.fi>
saved to /pub/dx/text/rec.radio.info currently stored as numbered files.

Effectively this means that anything you post to rec.radio.info will be permanently stored, so your work will not be lost.

-- I have a regular posting with timely information, is there a way to speed up it's delivery, or automate for more convenience?

Yes, there is! It may take a bit of chatter with the moderator, but we are willing to take responsible people and provide them the means of posting the articles directly from their site. We will try everything we can as we fully realize that DX (distant signal) and astronomical data can be somewhat transitory. We are also willing to allow regular posters of information the same courtesy, even if the information is not as time critical.

We refer to this as self-moderation, which is partly based on the model for news.answer. This requires co-operation and good will to be beneficial to the community in the rec.radio hierarchy.

I suggest reading the posting guidelines for more information. I am open to suggestions.

I thank the following individuals for their input into this article:
rec.music.info moderator Leo Breebaart rec-music-info@cp.tn.tudelft.nl
rec.radio.broadcasting moderator Bill Pfeiffer wdp@gagme.chi.il.us
Paul W. Schleck, KD3FU pschleck@unomaha.edu
Ian Kluft, KD6EUI ikluft@uts.amdahl.com

449. Keplerian Elements

Newsgroup: rec.radio.amateur.space
Date: 1994-03-31 18:25:08 UTC
From: ray.hoad@pubcon.com
Message-ID: <9403312301219@pubcon.com>
Source record: 27703

I just uploaded a fresh set of keps for 04/01/94 in this conference.
The files are AMSATKEP.ZIP (AMSAT format) and NASAKEP.ZIP (NASA 2-line).
73 Ray.

450. Important AMSAT-UK News

Satellite News 01APR94
Embargoed for automatic release at 0001 utc 01Apr94

** Phase-3D **
First of all the good news. The recent Ariane-4 crash will not affect the Ariane-5 system so the P3D launch is still on time. The bad news is that ESA have changed the launcher to payload interface yet again. The new system has the payloads metallically bonded together in order to achieve a more rigid structure; there was a latent wobble in the previous method of bolting the spacecraft to the rocket which led to several launches almost being destroyed. The new separation mechanism is designed around un-peeling the bond before firing the explosive bolts. The bond is similar to that found on some tins of fish products (and corned beef). ESA, mindful that their last change cost us considerable funds, have offered to lend us a tin-opener key for the flight.

Amsat-UK news of 01APR89 announced anti-alligator measures on future birds: "When spacecraft software detects a station running QRO, an extendible boom will deploy and cut the guy's co-ax." The boom of "CROCODILE" (Configurable Resource in Orbit Cutting Off Dumb Idiots Liable to Excess) used a radical metallurgical method to remove most boom material. The trouble with CROCODILE was that the guy just had to replace his co-ax and he was back, so it has been scrapped (anyone want an invisible pole 15,000km long ?) in favour of LEILA (Low Earth-orbit Insertion of Linear Amplifiers) which confiscates the guys amplifier and places it into an orbit with a mean altitude of 150km; its not stealing because the guy will be told exactly where his property is and can then retrieve it if he wishes (like having your car towed away for a parking offence).

Quote from Amsat-UK news of 01APR92:
"New on-board propulsion motors will, instead of ammonia, be fuelled by a blend based on the fermentation of baked beans, fried onions, guinness, and apple pie. Designers got the idea from last year's Colloquium."
unquote.
It seems that Amsat-UK Colloquium breakthroughs helped other P3D designs, not only the propulsion. Followers of P3D will know that short backfire antennas are to be included, as are parabolics; pity no-one acknowledged the source of the ideas as the UoS bar and shower rooms. Also, solar panel deployment is expected to be based on the actions of Amsat-UK Committee when they were waving their arms, trying to get everyone into the hall. It has been revealed that visitors to the 1994 Colloquium will be force-fed the mixture and equipped with tanks in order to collect the estimated 184Kg of propellant required.

** Help Column - Satellite FAQ **
Dear doctor:
Q. I built my own space rocket but it suffers from in-flight instability.

What can I do to make it more reliable ?
A. Use a longer stick.

Q. How can I make my 300bps modem work on the 9600bps satellites ?
A. run it from 384 volts instead of 12v.

Q. When will Dove speak ?
A. On re-entry; software for "aaaaarrrrggghhh" is easy.

Q. How can I afford the new gear for ALL the amateur satellites ?
A. Rob a bank.

Q. How can I get satellite DXCC in 90 minutes ?
A. Become a NASA mission specialist.

Q. How can I keep my UO-22 directory up-to-date ?
A. Patience; miracles are easy but the impossible takes a little longer.

Q. Why is Amsat-UK's new "Guide to Amateur Satellite Operations" book called "The New Guide to Amateur Satellite Operations" ?
A. Because its new.

Q. Why do Amsat-NA have to grovel for P3D donations of 10c/member while all Amsat-UK have to do is ask politely and receive thousands of pounds ?
A. The Brits put satellites before feeding their families.

Q. Why doesn't UO-11's digitalker answer me ?
A. You need a UO-11 voice modem.

Q. How can I keep my UO-22 directory up-to-date ?
A. Become a NASA mission specialist.

Q. How can I work FO-20 at 9600bps ?
A. Use the analogue transponder.

** Voice Satellites **
The first (amateur) voice from, rather than via, space came from UO-9; they have also come from UO-11, DO-17, AO-21, UO-22, KO-23, STS & MIR. The STS and MIR people are regularly supplied with food but we can now reveal how the men aboard the other "speaking" satellites are fed. Special containers are attached to the spacecraft's mains cord and lifted about 50Km by a spring mechanism. After that, centrifugal force takes over and propels the container the rest of the way. Once stocks have been depleted the containers, of aluminium foil, are filled with waste products and stored until the next meteor shower is due and are then discarded to rapidly re-enter without anyone realising what they were. They don't all burn up on re-entry. So next time you get showered by this polar foil material remember its all in the name of science.

Remember - you heard it first from Amsat-UK

Please use BID$ AMS_APR01 for terrestrial packet.

73 Richard G3RWL

454. AO-27&21, need kep's

Newsgroup: rec.radio.amateur.space
Date: 1994-04-01 03:50:02 UTC
From: andrews@fms.com
Message-ID: <CnKAnG.GIM@fms.com>
Source record: 27707

Hello all,

After reading about AO-27 and opperating AO-21 previously, I _really_
need a printout on these two satellites!

My ICBM is (this may need a little decoding!):
41 - 10 - 46
81 - 57 - 56
(this is near the Cleveland Ohio area)

I _really_ need a printout on these two satelites!!!

See ya on AO-27!!!!!!!

So long for now.... (Yea!)

457. AO-21&27, need kep's

Newsgroup: rec.radio.amateur.space
Date: 1994-04-01 03:56:12 UTC
From: andrews@fms.COM
Message-ID: <m0pmaL6-0000u5C@fms.com>
Source record: 27710

Hello all...

I _really_ need a printout of AO-21 & AO-27!!!!!!!

I have opperated AO-21 before, but can't wait to try AO-27 using QRP!

My ICBM (this may need some decoding!) is:
41 - 10 - 46
81 - 57 - 56
(I am located in the Cleveland Ohio area, if this helps)

I would _really appreciate_ knowing when _both_ sat's will be overhead.

See ya on AO-27!!!!!!!

So long for now... (yea!)

SpaceNews
=========

MONDAY APRIL 4, 1994

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It is published every week and is made available for unlimited distribution.

* LUNAR EXPLORATION CONFERENCE SCHEDULED *
==========
International Space Enterprises (ISE), a U.S. corporation planning a series of privately-financed missions to the Moon, has been selected to co-host an International Lunar Exploration Conference and Apollo commemorative event in San Diego. The conference is tentatively scheduled for 13-16 November 1994, which coincides with the 25th anniversary of America's second piloted mission to the Moon, Apollo 12. In addition to bringing together lunar scientists from all over the world, the event will kick off a nationwide educational initiative, whose ultimate goal is to fly a student experiment to the Moon by December 1997, the 25th anniversary of Apollo 17, the final Apollo mission to the Moon.

The November event will be co-sponsored by the National Space Society and the Spaceweek International Association, non-profit organizations dedicated to the expansion of human activities in space. The San Diego chapter of the National Space Society will work with ISE to develop the technical program for the conference, which will feature presentations and workshops on a variety of topics relating to exploration and utilization of the Moon. Spaceweek will manage the Apollo 12 commemorative event, planned as a gala fund-raising banquet on the evening of 15 November. Proceeds from the conference and banquet will be used for development and flight of the student experiment, which will be selected through a nationwide competition held during the 1995-96 academic year.

The specific site for the November conference will be selected within the next few weeks, and a preliminary conference program will be released in June. Details of the nationwide student experiment contest - which will be designed to involve students at all academic levels in the 1997 lunar mission - will be announced as they become available and a draft contest guidelines document will be presented at the November event. For additional information

please contact Tom Kessler of ISE at (619) 637-5772.

[Info via Franklin Antonio]

* UFO ON 2-METERS *
==========
G3IOR reported an unidentified satellite sending telemetry on 145.592 MHz. It was first heard by G3JQI in England at 18:50 UTC "dopplering" down until a 18:55 UTC LOS on 16-Mar-94.

Keep an ear out for this spacecraft, and send reception reports to SpaceNews.

* OSCAR-11 NEWS *
==========
G3RWL reports that UoSAT-OSCAR-11 is about to re-commence its regular news bulletin transmissions. The news bulletins are transmitted in ASCII on a frequency of 145.826 MHz FM AFSK at 1200 bps.

* SpaceNews AVAILABILITY *
==========
SpaceNews archives are now available via anonymous FTP at pilot.njin.net! Files may be found under the /pub/SpaceNews directory. All issues from 1993 have been zipped together in one file, while 1994 issues are available separately in ASCII form. The IP address for pilot.njin.net is 128.6.7.38, and answers to frequently asked questions, satellite software, and space related GIF images will be added in the not-too-distant future.

The latest issue of SpaceNews has been available to those with Internet access for some time by using the Unix "finger" command as follows:

finger magliaco@pilot.njin.net

Those without "finger" capabilities can receive SpaceNews via e-mail by sending a blank message to jfesler@netcom.com with a subject of #finger magliaco@pilot.njin.net.

SpaceNews is also available on Usenet under the newsgroups of rec.radio.amateur.space and sci.space.news, thanks to the folks at the University of California at San Diego. It is also available on the Amateur Packet Radio Network, and several of the "Pacsat" satellites, thanks to Pacsat ground stations who upload the issues to the birds each week.

SpaceNews has also been known to appear on the packet radio personal message system operated by the Cosmonauts on the Russian space station Mir. :-)

* SpaceNews BBS *
==========
A "SpaceNews" packet radio BBS has been established by Mario, KD6ILO in Tacoma, Washington. Mario reports the BBS carries SpaceNews, AMSAT, and NASA information, and serves the Puget Sound area on a frequency of 144.910 MHz. The BBS is also linked to the UoSAT-OSCAR-22 satellite through the N7RSN SatGate also located in Tacoma, WA.

* FO-20 SCHEDULE *
==================
The FO-20 command station announced that FO-20 will be placed in Mode JA
(Analog transponder mode) during Field Day 1994 (25-Jun-94 18:00 UTC through
26-Jun-94 18:00 UTC).

The current operating schedule is as follows:

Analog mode:
06-Apr-94 06:45 -to- 13-Apr-94 07:10 UTC
20-Apr-94 07:35 -to- 27-Apr-94 07:55 UTC
11-May-94 06:54 -to- 18-May-94 07:20 UTC

Digital mode:
Unless otherwise noted above.

[Info via Kazu Sakamoto, JJ1WTK]

* THANKS! *
===========
Thanks to all those who sent messages of appreciation to SpaceNews,
especially:

GM1SXX KA1CNK ON1EN KD6EFQ KD6ILO N8QPO

and First Lt. Walter Witt, N8DKI, of the USAF Auxillary Civil Air Patrol
who uses SpaceNews in teaching aerospace science to cadets between the ages
of 13 and 21.

* FEEDBACK/INPUT WELCOMED *

459. AO-27 Information

Newsgroup: rec.radio.amateur.space
Date: 1994-04-01 20:55:28 UTC
From: JAY@medicine.dmed.iupui.edu
Message-ID: <JAY.16.2D9C8A40@medicine.dmed.iupui.edu>
Source record: 27812

I have tried to monitor AO-27, but I haven't heard anything. I have been able to monitor AO-21 (at 145.987) with a HT with rubber duck antenna, but I can't hear the AO-27 with a large roof mounted antenna. According to the STS+ program, AO-27 is supposed to get close to Indianapolis on 4/3/94 at 11:28 - 11:43AM (EST). From the information I have found It's downlink frequency is 436.8 and it uses FM voice. Is this correct?

Thanks for your help.

Jay

460. Two-Line Orbital Element Set Format

Newsgroup: rec.radio.amateur.space
Date: 1994-04-02 00:09:00 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.765245340@afit.af.mil>
Source record: 27813
Cross-posted to: rec.radio.amateur.space,rec.radio.info

As a service to the satellite user community, the following description of the NORAD two-line orbital element set format is uploaded to sci.space.news and rec.radio.info on a monthly basis. The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity. In addition, element sets (also updated daily) and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 0 is a eleven-character name.

Lines 1 and 2 are the standard Two-Line Orbital Element Set Format identical to that used by NORAD and NASA. The format description is:

```
Line 1
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods, plus signs = 0; minus signs = 1)
```

Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6
1 11416U 86 50.28438588 0.00000140 67960-4 0 5293
2 11416 98.5105 69.3305 0012788 63.2828 296.9658 14.24899292346978

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

Latest information says that it is available for hams only on weekends
and when the satellite is in sunlight.

The commercial payload is in use more now.

73,
Ron w8gus.

GPS INFORMATION SOURCES
=======================
| (Revised 2 April 1994; revisions since previous update marked with bar '|')

Prepared by

Richard B. Langley
Geodetic Research Laboratory
Dept. of Geodesy and Geomatics Engineering
University of New Brunswick
Fredericton, N.B.
Canada E3B 5A3
Phone: (506) 453-5142
Fax: (506) 453-4943
Telex: 014-46202
e-mail: LANG@UNB.CA

Comments and additions to this document are welcome.

1. OFFICIAL CIVILIAN INFORMATION SOURCE
---------------------------------------

GPS INFORMATION CENTER
o Official U.S. Gov't. point of contact for civilian users
o Operated by U.S. Coast Guard
o Voice telephone recording for constellation status: (703) 313-5907
o Computer bulletin board: (703) 313-5910 (up to 14,400
bps) - almanacs, general information, etc.
Available via the Internet through the FedWorld BBS gateway system. Telnet
to fedworld.gov and from the top menu, type DD54 to connect to the GPSIC
BBS. See file GPSIC.VIA.INTERNET.INFO in the CANSPACE file archives (see
below) for more information.
o 24 hour watchstand personnel: (703) 313-5900; fax: (703) 313-5920
o WWV / WWVH shortwave broadcasts - constellation status
o DMA and USCG notices and broadcasts

2. ELECTRONIC INFORMATION SERVICES
----------------------------------

UNITED STATES NAVAL OBSERVATORY
o Responsible for monitoring behaviour of satellite clocks
o Clock data and general information on GPS available
from Automated Data Service (BBS): (202) 653-0155,
-0068, and -1079 (all bit rates); also available via the
```

Internet (192.5.41.239; anonymous ftp permitted; for telnet
connection, log in as ads -- a password is required -- GPS users may
contact Francine Vannicola, fmv@tycho.usno.navy.mil, for the password);
files also available via automated e-mail -- contact Francine Vannicola
for information
o USNO Series 4 mailed weekly bulletins contain satellite
clock info

INTERNATIONAL EARTH ROTATION SERVICE
o System maintained by IERS Central Bureau in Paris
o Earth orientation data from very long baseline interferometry,
laser ranging, and GPS observations
o Sets of space geodesy station coordinates
o UTC leap second announcements
o Access via anonymous ftp: mesiom.obspm.circe.fr (130.84.200.6)

2D SPACE OPERATIONS SQUADRON BBS
o Operated by U.S. Air Force 2d Space Operations Squadron, Falcon AFB, CO
o Service for GPS users from DoD, other U.S. GovUt. agencies, NATO, GovUt.
contractors
o Almanacs, NANUs, Operational Advisories
o DSN 560-6379; (719) 550-6379 (up to 2400 bps; N-8-1)

USAF GPS BBS AT HOLLOMAN AFB, NM
o Operated by U.S. Air Force 6585th Test Group; formerly at Yuma
o Daily almanac, observed range errors, tracking data
o (505) 679-1525 (variety of bit rates)

U.S. ARMY ELECTRONIC PROVING GROUND EGRIS BBS
o Operated by U.S Army
| o Accessible to military users and contractors worldwide
o NANUs, almanac and ephemeris data
| o For authorization to access EGRIS, contact Jack Underwood at USAEPG at
| (602) 533-8087
o (602) 538-3818 (300 and 1200 bps); (602) 538-3856 (9600 bps)

UNITED KINGDOM CIVIL SATELLITE GROUP ELECTRONIC BBS
o Operated by the University of Nottingham for the Royal Institution of
Navigation
o Full access is only available to members of UKCSG
o +44-602-422111 (2400 bps)

GPSINFO ELECTRONIC VIDEOTEX BBS
o Operated by the Survey Department of Rijkswaterstaat, (the Dutch
Ministry of Transport and Public Works), Delft
o +31-15-561959 (1200 and 2400 bps)

GPS INFO ELECTRONIC BBS
o Operated by Statens Kartverk (the Norwegian Mapping Authority),
Honefoss.
o +47-321-24045 and -18369 (1200 and 2400 bps)

GLOBAL SATELLITE SOFTWARE BBS
o Operated by Global Satellite Software, Inc., San Jose, California
o (408) 252-7358 (300 / 1200 / 2400 bps)

GIBS - GPS INFORMATIONS- UND BEOBACHTUNGSSYSTEM (INFORMATION AND OBSERVATION SYSTEM)
o Operated by Institut fuer Angewandte Geodasie, Frankfurt/M, Germany
o +49-69-6333-379 and -418 (up to 19200 bps)
o Available via Internet: Telnet to no5.ifag.de (141.74.240.25)
o A GPS status report in German is available at +49 341 5634-380. The report is updated at the beginning of each working day.
o Further information from gibs@no5.ifag.de

GRINEL - PROFESSIONAL ELECTRONICS BBS
o Verwoerdburg, South Africa
o Operated by Grinel Professional Services on behalf of the Southern Africa GPS User Group
o Status advisories, almanac
o +27-12-663-2583 (300 to 2400 bps)
o According to a report from South Africa dated 4 October 1993, this BBS is no longer active

KORT- OG MATRIKELSTYRELSEN BBS
o Kobenhavn, Denmark
o +45-3-185-3541 (up to 2400 bps)

ASSOCIATED CONSULTING INC. BBS
o Las Vegas, Nevada, U.S.A.
o (702) 647-9266 (300/1200/2400 bps)

NATIONAL LAND SURVEY BBS
o Gavle, Sweden
o +46-26-153748 (up to 19200 bps)

AUSLIG GEODESY ELECTRONIC BBS
o Operated by Australian Surveying and Land Information Group
o Constellation status, almanac data, related geodetic information
o +61-6-201-4375 or -4378 (300 to 600 bps)

CANADIAN SPACE GEODESY FORUM
o A LISTSERV-based discussion and information electronic mailing list
o Address of list: CANSPACE@UNB.CA
o Address for further information: LANG@UNB.CA
o File archive in "directory" PUB.CANSPACE on unbmvs1.csd.unb.ca (131.202.1.2) available by anonymous ftp
o File archive also available via Gopher;
URL: gopher://unbmvs1.csd.unb.ca:1570/1EXEC%3aCANSPACE
o Latest DoD NANUs may be obtained by "fingering" gps@geomac.se.unb.ca

| INTERNATIONAL GPS SERVICE FOR GEODYNAMICS
| o System maintained by IGS Central Bureau at JPL in Pasadena
| o Information about access to tracking data from global tracking network
| o Precise GPS satellite orbits generated by IGS Analysis Centers
| o Information about IGS Tracking Stations, Data Centers, Analysis Centers

| o GPS System Status Information
| o Access via anonymous ftp: sideshow.jpl.nasa.gov (128.149.70.41)

| CZECH TECHNICAL UNIVERSITY GPS/GLONASS GOPHER SERVER
| o Operated by the Group of Signals and Systems, Department of
| Radioelectronics, Faculty of Electrical Engineering, Czech Technical
| University, Prague
| o Host: gopher.feld.cvut.cz (147.32.192.5)
| o Bilingual: Czech/English
| o Data concerning Navstar GPS and GLONASS including the status of the
| systems (number of working satellites and whether they are usable or not)
| and almanac data for all satellites.
| o All data are based on the monitoring of both systems at the Czech Technical
| University
| o Suggestions and comments should be forwarded to BROUM@feld.cvut.cz or
| SEIDL@feld.cvut.cz

| WORLD WIDE WEB
| Hal Mueller of the Dept. of Agricultural Engineering at Texas A&M University
| has put together a very good hypertext document containing pointers to a
| number of items on GPS along with ones on GIS, remote sensing, and various
| other geosciences that can be found on the Internet. The uniform resource
| locator (URL) for the hypertext document is
| http://ageninfo.tamu.edu/geoscience.html
| Simply enter the URL into Mosaic or another WWW browser to access the
| document.

OTHER GPS MAILING LISTS
o GPS DIGEST
Moderated by Andy Arkusinski and Ken Jongsma of Smiths Industries, Grand
Rapids, MI.

According to the moderators ...
The GPS Digest is a forum for the discussion of topics related to the USAF
Global Positioning System (GPS) and other satellite navigation positioning
systems. The GPS Digest is moderated and is not presently available via
USENET newsgroup. Submissions should be made to gps@tws4.si.com.
Administrative requests [including requests to be added to the mailing
list] should be made to gps-request@tws4.si.com.
The digests are archived in the CANSPACE file archives.

o GPStech
The GPStech Mailing List
| Operated by Jeff Freymueller, Department of Geophysics, Stanford University

| GPStech is an unmoderated mailing list for the discussion of GPS technical
| and other issues. The intention is to provide a forum for the exchange of
| information, for discussion of the finer technical points that always seem
| to trip us up, and for questions about particular GPS analysis software.

| While the original intent of the list was to provide a forum for discussion
| of topics involved in high-precision geodetic GPS (for surveying and

| crustal deformation applications), topics involving GPS navigation are
| welcomed as well.

| Both question-and-answer and open debate/discussion are encouraged. New
| members are encouraged to ask questions and suggest topics of discussion
| (as are longtime members for that matter).

Use the following mail addresses to access the GPStech list:

gpstech@cotopaxi.stanford.edu -- to post a message
gpstech-request@cotopaxi.stanford.edu -- to join or quit the list

USENET
Several USENET news groups have occasional postings related to GPS. Among
them are
o comp.infosystems.gis (gatewayed with the LISTSERV list
GIS-L@UBVM.CC.BUFFALO.EDU)
o rec.aviation.misc
o rec.boats
| o sci.electronics
o sci.space
o sci.space.news
| A new USENET news group, sci.geo.satellite-nav, has recently been established.

3. PERIODICALS

GPS WORLD MAGAZINE
o Monthly magazine covering the spectrum of GPS usage
o Current regular subscription rates: US $59, Canada $79, Foreign $117
o Special subscription rates may be offered from time to time
o Free subscriptions may still be available for qualified individuals
o Advanstar Communications
P.O. Box 10460
Eugene, Oregon 97440-2460
U.S.A.
Phone: (503) 343-1200
Fax: (503) 683-8841
Telex: 510-597-0365

GPS WORLD NEWSLETTER
o 6-page newsletter published twice a month by Advanstar Communications
o For subscription information, contact GPS World at the address and phone
numbers above

GPS REPORT
o 8-page newsletter containing news and analysis on commercial and military
applications of GPS
o Also available electronically via NewsNet and Predicasts
o Phillips Business Information, Inc.
7811 Montrose Road
Potomac, MD 20854
U.S.A.

Phone: (301) 340-2100
Fax: (301) 424-4297
Telex: 358149

CSTG GPS SUBCOMMISSION'S GPS BULLETIN
o Bulletin of the GPS Subcommission under Commission VIII, International Coordination of Space Techniques for Geodesy and Geodynamics of the International Association of Geodesy and the International Union of Geodesy and Geophysics
o Reports on GPS developments related to high accuracy uses of GPS
o Status of the Cooperative International GPS Network (CIGNET)
o GPS Bulletin is prepared and distributed by the National Geodetic Survey, National Oceanic and Atmospheric Administration, U.S. Department of Commerce
o Editor: Miranda Chin
NOAA, N/OES13
1305 East-West Highway
Silver Springs, MD 20910
Phone: (301)713-2852
Fax: (301) 713-4475
e-mail: miranda@gracie.grdl.noaa.gov
o According to a report received on 9 November 1993, the GPS Bulletin is no longer being published.

GNSS UPDATE
o Irregular publication of Transport Canada's Global Navigation Satellite System Working Group
o Editor: Deborah Martin
Transport Canada
Place de Ville, Tower "C"
Ottawa, Ontario
K1A 0N8
Attention: AANDDB
Fax: (613) 998-7416

SATNAV NEWS
o Quarterly publication on developments at the Federal Aviation Administration's Satellite Program Office
o Available in electronic form from the CANSPACE file archives (see above)

5. PAPERS AND ARTICLES

A series of six articles on GPS receivers (primarily the transputer-based receivers developed by Inmos) by Philip Mattos, a consulting engineer with Inmos/SGS-Thomson, was published by Electronics World + Wireless World between December 1992 and May 1993. In addition to receiver details, the articles also cover the theory of operation of GPS, GPS antennas, and various GPS applications. Note that the constructional kit and newsletter mentioned in the sixth article are not available and that there are some minor errors here and there scattered through the articles.

Mattos, P. (1992). GPS. Electronics World & Wireless World, No. 1681, pp. 982-987.

6. GPS BIBLIOGRAPHY

A GPS Bibliographic Subscription Service is offered by Canadian GPS Associates, publishers of the Guide to GPS Positioning. This service provides twice-yearly updated editions, listing GPS-related publications from journals, newsletters, reports, and proceedings of GPS-related conferences.

The Premier Edition, issued in late 1992, contained 4,358 entries. This grew from a 1,000-entry bibliography prepared in 1989 at the University of New Brunswick for the U.S. Army Corps of Engineers (Dredging Research Program Technical Report DRP-92-2, available in electronic form as message #5296 on the U.S. Coast Guard's GPS Information Center Bulletin Board). At 8,802 entries, the July 1993 Edition has doubled in size.

The GPS Bibliography is available in both hard-copy and computer-readable form on PC or Macintosh diskettes. The PC diskette version is available in either the standard CSV (comma-separated-variables) text format, or dBase III format. For Macintosh users, the format is tab-separated field text format.

464. EME contest scheduling

Newsgroup: rec.radio.amateur.space
Date: 1994-04-03 17:39:49 UTC
From: broz@csn.org
Message-ID: <199404031739.AA27700@teal.csn.org>
Source record: 27818

About a week ago someone (I believe it was a G) posted a detailed analysis for the optimum weekends for the EME contests, based not only on visibility and S/N ratio, but also on European contest conflicts. I seem to have erased that day's email and would like to receive another copy if someone could be so kind. The scheduling has become a minor topic on the contest reflector and I wanted to be up on all of the issues.

Thanks in advance. John W0UN broz@csn.org

(On EME myself, but only at HF! Have gotten excellent echoes on 10M with a 32 element array and fair (at best) echoes on 15M with a 28 element array.)

AMSAT-Austria Sponsors Space Education Seminar 16-APR-1994 In Innsbruck

The AMSAT-Austria group (AMSAT-OE) will announce their first Educational Development Seminar meeting using the amateur radio satllites AO-21 and DOVE (DO-17). It is most fitting that these satellites will be used to broadcast the announcement of this meeting because the theme is the advancement science education through use and observation of OSCARs. Look for the announcement from DOVE beginning on 15-APR-1994 in its telemetry broadcasts and look for the synthesized voice message from AO-21 this week.

The meeting will take place on 16-APR-1994 at the Technical Highschool of Innsbruck, Austria and is being sponsored by the Department of Electronics and Telecommunication. The presenters planned will be OE1VKW, DG2CV, and EA2CLS/KB7HTA, and I2KBD. All of these radio amateurs are well know in educational circles. They have a lot of interesting information for those in attendence. All are invited to join AMSAT-OE at this seminar. For more information, contact Wolf Hoeller (OE7FTJ) at his INTERNET address of uibk.ac.at.

[The AMSAT News Service would like to thank Wolf Hoeller (OE7FTJ) for this bulletin item.]

N8QGC & N4TPY Offer Some Operating Suggestions For AMRAD-OSCAR-27 (AO-27)

N8GQC has been working staions on AO-27 all the way from his Detroit area QTH to as far away as Mexico City, Mexico, Baffin Island, and the North West Teritories. He notes that these are great contacts for a Low Earth Orbiting (LEO) satellite. In his discussions with the AO-27's ground control station station operator N4TPY, N8GQC has put together a list of "good

operating practices" that N4TPY would like all those who use AO-27 to follow:

1. Please use as little power as possible. It is recommended that you use your H/T when possible. If not, then use no more then 25 Watts ERP.

2. Please try to be kind to other satellite operators. The object should be to make as many contacts as you can, and to step on as few as possible.

3. The satellite has no set schedule of availability at this time. The control stations will make it available only on weekends during daylight passes. Sometimes during the week AO-27 may also be on, but it will be "hit or miss."

N8QGC has worked AO-27 with a very simple set up. He transmits on the uplink frequency of 145.850 MHz using a homebrew 1/4 wave vertical antenna. His total uplink power is 10 watts. N8GQC find that this gives him a very strong signal into the satellite. But he especially wants hams to know that he has also worked AO-27 using a H/T with a "rubber-duck" antenna and 2.5 watts output! However, receiving this satellite can be somewhat difficult. N8QGC uses a KLM 440-6X antenna to receive. This is the the same 6 element UHF YAGI that he uses for transmitting on AO-21 when he isn't communicating through AO-27. AO-27's downlink can be heard on on 436.800 MHz. N8QGC is in the process of experimenting with several different receiving antennas. For mobile operations using AO-27 he has tried using his full-wave 70CM antenna on the car but has noted that doesn't work very well. On the receive side, he reports, it still takes a 6 element Yagi antenna.

By keeping the above suggestions in mind, all users of AO-27 will be able to enjoy it to its fullest capabilities.

[The AMSAT News Service would like to thank N8GQC & N4TPY for this bulletin item.]

SATELLITE W.A.E.Z.S. AWARD

HR AMSAT NEWS SERVICE BULLETIN 092.03 FROM AMSAT HQ
SILVER SPRING, MD APRIL 2, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-092.03

Worked All European Zones by Satellite (W.A.E.Z.S.) Award Available

AO-10 and AO-13 user Mario Di Iorio (IW6BNC) is active from his QTH in Macerata located in the center of Italy, grid square JN63RH. Mario is also the manager of W.A.E.Z.S (Worked All European Zones by Satellite) Award. Mario reports that very few radio amateurs know of the existence of this award. The European zones are: 14, 15, 16, 20, and 40. The award is divided

into a bronze, silver, and gold award. The follwing is the criteria for each catagory:

1) The basic award or the "Bronze" award can be obtained with a single QSO with any radio amateur station in Macerata, Italy and 3 European zones.

2) The "Silver" award can be obtained with making contacts with 4 European zones and 1 operator from Macerata, Italy.

3) The "Gold" award can be obtained with 5 European zone contacts plus one contact from any station in Macerata, Italy.

The follwoing are the only valid amateur radio operators from Macerata. And they are are: 1) IK6LMB, 2) IW6BNC, 3) IK6MQM. Send your requests for this award to:

W.A.E.Z.S AWARD MANAGER
c/o A.R.I. MACERATA
P.O. BOX 66
62100 MACERATA - MC ITALY

and please include 10 IRCs.

The orginal QSL cards are not needed as proof of confirmation of the contacts but only a list of QSOs containing all the details of the contacts between the stations involved. This award is valid for a single satellite but it changes with respect to the different modes of operation, e.g., SSB, CW or a mix of the the two modes. IW6BNC hopes to see many stations striving to obtain the W.A.E.Z.S award. If you have further questions about this award and its rules, direct your inquiries to:

Mario Di Iorio (IW6BNC)
P.O. Box 66
62100 Macerata - MC
Italy

Or you can send IW6BNC a packet message to his local packet radio BBS of IW6BNC @ IW6BET.MC.ITA.EU.

LATEST ZRO TEST NOTES

HR AMSAT NEWS SERVICE BULLETIN 092.04 FROM AMSAT HQ
SILVER SPRING, MD APRIL 2, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-092.04

WA5ZIB Offers The Some Observations On The Recent AO-13 ZRO Tests

The current round of ZRO Tests via AO-13 are complete. No tests were missed and all went well. Some interference was experienced on the Feb-ruary 19th test, but it was not critical. The tests of February 19th and

26th were completed just prior to AO-13's switch to Mode "S" with no time available for discussion with participants after the tests. These ZRO tests were scheduled very close to the mode-switch time due to a minor error in predictions made months in advance. The February 26th test was begun a few minutes early to ensure that all levels would be sent prior to mode switch. Many thanks to those on the AO-13 AMSAT Operations Net that identified the potential schedule conflict before it became a problem.

No new Z9 reports have yet been received, but there's plenty of time to send in submissions. There is no charge for copy verification although an S.A.S.E. is appreciated. Send your copy to: Andy MacAllister (WA5ZIB), AMSAT V.P. User Services, 14714 Knights Way Drive, Houston, TX 77083-5640.

More tests will be scheduled during the next season of Nadir pointing for AO-13. The dates will be posted to the AMSAT News Service (ANS).

SB SAT @ AMSAT $ANS-092.05
WEEKLY OSCAR STATUS REPORTS

HR AMSAT NEWS SERVICE BULLETIN 092.05 FROM AMSAT HQ
SILVER SPRING, MD APRIL 2, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-092.05

Weekly OSCAR Status Reports: 02-APR-94

AO-13: Current Transponder Operating Schedule:
M QST *** AO-13 TRANSPONDER SCHEDULE *** 1994 Mar 19-Apr 04
Mode-B : MA 0 to MA 90 |
Mode-BS : MA 90 to MA 120 |
Mode-S : MA 120 to MA 122 |<- S beacon only
Mode-S : MA 122 to MA 145 |<- S transponder; B trsp. is OFF
Mode-S : MA 145 to MA 150 |<- S beacon only
Mode-BS : MA 150 to MA 180 | Blon/Blat 180/0
Mode-B : MA 180 to MA 256 |
Omnis : MA 230 to MA 30 | Move to attitude 235/0, Apr 04 240/0, Apr 04
[G3RUH/DB2OS/VK5AGR]

FO-20: The following is the current schedule for transponder operations:
ANALOG MODE:
6-Apr-94 6:45 -to- 13-Apr-94 7:10 UTC
20-Apr-94 7:35 -to- 27-Apr-94 7:55 UTC
11-May-94 6:54 -to- 18-May-94 7:20 UTC
Digital mode: Unless otherwise noted above.
[Kazu Sakamoto (JJ1WTK) qga02014@niftyserve.or.jp]

AO-21: N8QGC has been working AO-21 from Detroit QTH and notes that AO-21 is operating normally. It is on the following schedule: 5 minutes of FM repeater operation followed by 4 minutes of WEFAX transmissions. Finally, the cycle is conclued with 1 minute of packet before switching back to FM repeter mode. [N8QGC]

AO-27: AO-27 now acting as a 'J' mode FM transponder and is proving very popular in Europe, with increased activity daily. It has a strong excellent quality downlink that can easily be heard on a hand-held receiver on 436.800 MHz +/- some 10 KHz of shift Doppler shift correction. It's sensitivity is far greater than 'B' Mode on AO-21. If there are no QRO stations on 145.850 MHz (+/- some 3 KHz of Doppler shift), uplinking using a hand-held which can produce 2 watts ERP is capable of putting an excellent full quieting signal into the transponder. As evidence G3IOR has worked several other European stations using 2.5 watt hand-held dual-band transceivers and for optimum footprint coverage to VE8DX who was running just 3 watts into a ground plane omni-directional from Baffin Island. All were fully quieting signals! [G3IOR]

STS-59: A brief reminder that STS-59 is scheduled to be launched on 07-APR-94 at 12:07 UTC and will carry the Shuttle Amateur Radio Experiment (SAREX) payload. For complete details, please refer back to the $ANS-071.02 bulletin.

The AMSAT NEWS Service (ANS) is looking for volunteers to contribute weekly OSCAR status reports. If you have a favorite OSCAR which you work on a regular basis and would like to contribute to this bulletin, please send your observations to WD0HHU at his CompuServe address of 70524,2272, on INTERNET at wd0hhu@amsat.org, or to his local packet BBS in the Denver, CO area, WD0HHU @ W0LJF.#NECO.CO.USA.NOAM. Also, if you find that the current set of orbital elements are not generating the correct AOS/LOS times at your QTH, PLEASE INCLUDE THAT INFORMATION AS WELL. The information you provide will be of value to all OSCAR enthusiasts.

/EX

466. HELP: My Satellite Tracking Program Won't Work

Newsgroup: rec.radio.amateur.space

Hello,

I downloaded the program sattrack for my UNIX box at home and compiled
it under linux. Everything went okay until I tried the program. The
program kept on telling me that the satellites have "crashed already".

I tried AO-21, Mir and Oscar 13, they all gave me the same result, and
I know, for a fact, that the satellites have not been crashed :-).

Please help me, thanks in advance.

468. SatTrack

Newsgroup: rec.radio.amateur.space
Date: 1994-04-04 20:34:41 UTC
From: HEAGYWS@ctrvax.Vanderbilt.Edu
Message-ID: <1994Apr4.203441.4071@news.vanderbilt.edu>
Source record: 27822

I'm sorta new to this sat. tracking stuff but am trying to get a
handle on it. A friend gave me a shareware copy of SatTrack to
try out. The data file seems very old. Does anyone know where
I could get up to data data files for SatTrack?

Thanks...Win
heagyws@ctrvax.vanderbilt.edu

470. Az/El Rotator suggestions wanted

Newsgroup: rec.radio.amateur.space
Date: 1994-04-04 22:22:11 UTC
From: debaker@bnr.ca
Message-ID: <2nq3uj$4rf@crchh7b0.bnr.ca>
Source record: 27824

Hello,

I am looking for suggestions on homebrewed or inexpensive az/el
combos. I have looked at the kilobuck stuff from Yeasu and similiar
makers, but am wondering if there are any kits or ideas for cheaper
construction. I have read just about every satellite publication,
so I have already seen a lot. I am trying to identify any designs
that use inexpensive rotators (like the R/S TV rotator), and gear
them down and perhaps modify them for greater than 360 degree rotation
in order to get better weight loading and granularity in adjustment.
If anyone knows of any ideas or plans (or knows about the R/S rotator),
please let me know.

Thanks,
+---+

SB SAREX @ AMSAT $STS-59.001
STS-59 Mission Delay

The STS-59 SAREX mission has been delayed 24 hrs due to some extra inspections that need to be performed at the launch site. Tentative launch will be on April 8 at 12:07 UTC.

A new set of Keplerian Elements will be provided in the near future.

Submitted by Frank H. Bauer, KA3HDO for the SAREX Working Group

473. best 2m lin/circ antenna

Newsgroup: rec.radio.amateur.space
Date: 1994-04-06 14:47:14 UTC
From: thooker@psl.nmsu.edu
Message-ID: <thooker.31.000EC9FB@psl.nmsu.edu>
Source record: 27830

I am looking to buy a very hi quality, 2m beam antenna. I would like something better than Cushcraft. I will be purchasing a crossed YAGI, but desire to operate only one polarization at a time, ie horizontal (for ssb) or vertical (for FM). Bandwidth needs to be entire 2m band.

I will need to remove the matching / phasing network and use to feedlines, feeding one set of elements at a time to achieve linear pol.

I have got price quotes on M squared and KLM antennas, but I have never seen the actual mechanical construction used in these brands. My QTH is in a high wind envionment, and I desire to have the connections to the elements enclosed (as I believe the M squared is).

Any info will be appreciated.

474. SPACE STATION SYSTEM DESIGN REVIEW COMPLETED

Newsgroup: rec.radio.amateur.space
Date: 1994-04-06 16:17:59 UTC
From: postmaster@asarin.ORG.AR
Message-ID: <gate.ocqDkc1w165w@asarin.org.ar>

SPACE STATION SYSTEM DESIGN REVIEW COMPLETED

Mark Hess
Headquarters, Washington, D.C.
March 24, 1994

Kari Fluegel
Johnson Space Center, Houston

RELEASE: 94-53

Plans for the International Space Station are maturing rapidly and the orbiting research facility is on track for assembly to begin in 1997 as scheduled, program managers said today after completion of the system design review.

"This was a major milestone for the International Space Station," said Space Station Director Wilbur Trafton. "The space station team has just conducted a comprehensive review of the requirements, configuration and the maturity of the station's technical definition. We now have a solid baseline for the program. We have an executable schedule with costs that maintain acceptable reserves within our budget cap."

A major milestone in the space station program, the system design review (SDR), included participants from NASA, the Canadian Space Agency, the European Space Agency, the Italian Space Agency, the Japanese Space Agency, the Russian Space Agency, the prime contractor Boeing and Tier I subcontractors Rocketdyne and McDonnell Douglas.

Managers reviewed and evaluated the overall configuration, technical requirements and detailed specifications for the space station during the meeting which concluded Wednesday at the Johnson Space Center.

"I'm extremely pleased with the results of this program review," said Program Manager Randy Brinkley. "The results of the SDR demonstrate that the International Space Station has a high degree of design maturity. This program is right on track to providing the science community with a world class orbiting laboratory."

The SDR resulted in a consensus among program managers on the technical validity of the design and completeness of the station's system specifications, the operations concept and requirements for interfaces with the Space Shuttle and Russian launch vehicles. Refinements to cost and program schedules also were presented.

Baseline Configuration

Using approximately 75 percent of Space Station Freedom hardware, the completed International Space Station consists of U.S. elements including the integrated truss, habitation module and laboratory module; the Russian science power platform, service module and functional cargo block vehicle (FGB); the ESA laboratory module; Japanese experiment module and exposed facility and the Canadian remote manipulator system.

The station will operate at an altitude of approximately 240 n.m. (444 km) and will orbit in a 51.6 degree inclination which will offer better Earth observation opportunities. The International Space Station increases crew size from four to six. It will have 33 standard user racks for science operations.

Schedule

The planned assembly of the station will begin with launch of the Russian "FGB" vehicle in November 1997. A docking compartment will be added before the first American launch in December 1997. The Russian service module will be added to the station in January 1998 followed by the universal docking module and the science power platform. The U.S. laboratory module will be launched on the third U.S. flight in May 1998 and will signal the beginning of human-tended science operations.

The Canadian-built robotic arm will be launched on the next flight in June 1998 and the addition of the Soyuz transfer vehicle in August 1998 will provide capabilities for extended on-orbit operations. The Japanese experiment module will be launched in early 2000 and the ESA laboratory module will be added in June 2001. Assembly will be complete in June 2002. In total, the sequence provides for 13 Russian assembly flights and 16 U.S. assembly flights. Use of the Ariane V launcher to lift the European module to the station also has been added to the technical baseline.

Cost

The U.S. contribution to the station is estimated to cost $17.4 billion from Fiscal Year 1994 until assembly is complete in 2002. This includes annual budget appropriations of about $2.1 billion and consists of development, vehicle and ground operations costs and utilization support during the assembly period.

International Partner Status

Canada completed the critical design review for the Space Station remote manipulator system in 1993. Changes in the subsystem design requirement and assembly sequence currently are being addressed.

The critical design review for the Japanese experiment module is scheduled for 1996. Currently all development activities are on track for launch in early 2000. The European attached pressurized module (APM) preliminary design review is scheduled for 1996 with the critical design review scheduled for 1998. Program managers also are investigating the feasibility of launching the APM on an Ariane V booster as a baseline.

The inter-government agreements for the station currently are being amended to include Russia as a full partner. The memorandum of understanding

and joint management plan with Russia will be completed in mid-1994 and negotiation of a fixed price contract is currently in work.

Extravehicular Activities

The amount of extravehicular activity (EVA) in the critical path for station assembly has been significantly reduced. EVA crew hours for maintenance during the station's 10-year operational lifetime also have been significantly reduced.

Ground Control

The ground system for the International Space Station builds on the interfaces for the Shuttle and Freedom programs. The design is being optimized to reduce developmental and recurring costs. All drivers for the ground control systems are well understood and the final specification will be baselined for May.

Station systems

All station systems have a high degree of design maturity. For example, the guidance, navigation and control system design is 97 percent complete. The communications and tracking system design is very mature and analysis and testing to date show that all station requirements will be met. The critical design reviews for the audio, video, S-band and Ku- band systems have been completed with more than 90 percent of the flight material on order or available inhouse. The thermal control system has been significantly simplified. The external active thermal control system has the most significant changes but still retains 40-50 percent of the previous hardware designs.

The internal active thermal control system retains 80-90 percent and the photovoltaic active thermal control system retains 100 percent of the existing hardware design. Also, analysis shows that designs for the life support systems also are progressing well with development programs completed for all major subsystems. A number of key environmental system tests have been completed using prototype hardware and 90 percent of the hardware has passed a critical design review.

Transition Activities

Since the transition activities began last fall, 1,050 open issues from the Freedom program have been resolved. Another 471 new program issues also have been closed during that time. At the close of the SDR, only 17 issues remain open. Those issues include providing for additional on-orbit payload storage, addressing Japanese experiment module and ESA module ventilation noise levels and determining the location and specifications for an optical quality window in the station design.

"We've closed nearly 100 issues for every technical issue still to be resolved and for the few remaining open items, each has a plan on how to close it and a timetable within which it will be closed," Trafton said. "The team is tackling the tough issues, making decisions and moving ahead with a space

station that can be built on schedule and at the cost which the Administration and the Congress have established for this program."

With the completion of the SDR, the space station team will refine the design to more detailed levels. In April 1995, the program will conduct the critical design review for the station, a milestone that means the detailed engineering design essentially will be complete.

"We have come a long way in a short amount of time, and that is due to an unbelievable level of professional dedication and hard work by all the program team members," Brinkley said. "Because of these people, the International Space Station will be on orbit and performing valuable science as the nation and the world enters the next century."

In general, the elevation mechanism is *difficult* part. If you are willing to do some metal work, you can provide elevation with an actuator arm from a satellite tv dish. Most of these will lift a pretty fair load, but if the array is well balanced, it really doesn't have to lift much at all. You can find these things brand new for as little as $59 (for an 18" arm). If you are willing to go with used stuff, you can probably find them for alot less. If you can find the right tvro dealer, you might be able to get an older used model for free. (One dealer up here told me they just toss them in the garbage. Of course when I told them I was interested they wanted $50).

If you are interested in this method, there is one such setup described in the "SPACE COMMUNICATIONS" section of the newer ARRL handbooks (I think since at least 1991).

The two main disadvantages of this method are you are limited to about 90 degrees or so of elevation, and you will also probably have to build your own position readout system. This method of course will require that you build your own mount. It's not quite as simple as sliding a mast through the rotor, but it can be done alot cheaper.

Hello,

I have been looking into satellite antennas, and it seems that KLM is
the brand of choice...I am interested in hearing from anyone who has
a KLM for sale. All four models (14C, 18C, 22C, 40CX) are of interest.

If you have another brand of satellite antenna for sale, let me know
anyway... A good value is not to be passed up.

Thanks,

```

I just wanted to add my name to the list of people interested in the GPS module purchase. The final price quote will determine if I am in or out, but if the estimated per unit price for the 100 lot is correct it should not be a problem.
Thanks, Dave WA3YDZ

SB SAREX @ AMSAT $STS-59.002
STS-59 SAREX Flt Info

Launch of next SAREX mission imminent

The next Shuttle Amateur Radio Experiment (SAREX) mission is ready for launch at the Kennedy Space Center in Florida. This flight, designated STS-59, is scheduled for launch on Friday April 8 at 12:06 UTC. Weather conditions could cause the launch to move forward or back by one hour. STS-59 will carry Jay Apt, N5QWL and Linda Godwin, N5RAX on a nine day mission which will include packet radio and some voice operations. A SAREX fact sheet, courtesy of Jay Apt, the ARRL and AMSAT follows. Note that during this mission, the JSC ARC, W5RRR, expects to retransmit NASA Select audio on AO-13. The planned downlink frequency will be 145.84 MHz. In addition the JSC ARC crew in Houston have set up a dial-in BBS which is now in operation. Orbital elements will be available on this machine throughout the mission. The phone number for the BBS is (713) 244-5625. Please use 9600 baud or less.

SAREX FACT SHEET - STS-59

WHO: Space Shuttle Endeavour crew

WHAT: Talk via Amateur Radio with students and radio amateurs on Earth.

WHERE: Earth Orbit. Altitude 220 kilometers, with radio coverage in latitudes from 70 degrees North to 70 degrees South. This flight is in one of the lowest altitude orbits ever flown by the shuttle, so pass times will be shorter than usual.

OPERATORS: Dr. Jay Apt (N5QWL) and Dr. Linda Godwin N5RAX.

N5QWL is the commander of the Blue Shift aboard Endeavour and will operate the shuttle systems during the "night" shift, while N5RAX is the Payload Commander, responsible for overall operation of three large radars in the shuttle's cargo bay during the "day" shift.

WHEN: April 8, 1994 at 12:06 UTC (9 day mission)

WHY: As part of the Shuttle Amateur Radio EXperiment (SAREX) component of the STS-59 mission.

SPONSORS: The American Radio Relay League (ARRL), The Radio Amateur Satellite Corporation (AMSAT) and The National Aeronautics and Space Administration (NASA).

SAREX MODES: FM Voice and Packet
VOICE CALL SIGNS: N5QWL and N5RAX
PACKET CALL SIGN: W5RRR-1

SAREX RADIO FREQUENCIES:
Voice Downlink: (Worldwide) 145.55 MHz
Voice Uplink: 144.91, 144.93, 144.95, 144.97, 144.99 MHz
Voice Uplink: (Europe only) 144.70, 144.75, 144.80 MHz
Packet Downlink: 145.55 MHz
Packet Uplink: 144.49 MHz

Successful QSOs on voice will be facilitated by using
standard international phonetics for your call sign.
The crew not answer any stations using non-standard
phonetics. Use your entire call sign -- the crew logs with an
audio tape recorder. Do not use the Shuttle call sign --
passes are very short, and the crew wants to work as many
folks as possible.

If you can, decrease your radio's deviation to 3 KHz (most are
initially set at 5 KHz) and compensate for the Doppler shift. If
you cannot, wait until a minute or 90 seconds after the Shuttle comes over
your horizon to transmit -- that will put you within the SAREX IF. The above
applies to both voice and packet.

INFORMATION: Goddard Amateur Radio Club, Greenbelt, MD, WA3NAN. SAREX
news and NASA Mission audio retransmissions on 3.86, 7.185,
14.295, 21.395, and 28.65 MHz and on VHF at 147.45 MHz.

Johnson Space Center Amateur Radio Club, Houston,TX, W5RRR.
SAREX news bulletins on HF bands at 3.850, 7.227, 14.280,
21.350, and 28.400 MHz and VHF at 146.64 MHz.
Also 145.84 on AO-13 at times

ARRL, Newington, CT, W1AW.
SAREX news bulletins (9:45 PM, 12:45 AM EST) on
HF bands at 3.99, 7.29, 14.29, 18.16, 21.39, 28.59
and VHF at 147.555 MHz.

PARTICIPATING
SCHOOLS: Ealy Elementary School, West Bloomfield, MI
Kanawha Elementary School Davisville, WV
Alcatel Amateur Radio Association and Circle 10 Council-BSA
Richardson, TX
Anthony Elementary, Anthony, KS
St. Bernard High School, Playa Del Rey, CA
Country Club School, San Ramon, CA 94583
Deep Creek Middle School, Baltimore, MD 21221
Paltamo Senior High School, Paltamo Finland
Ogilvie School, Northampton, Western Australia

OPERATIONS NOTES:
If you have a packet QSO number issued to you by the
robot, don't try to get another one! The on-board

program drops the duplicates anyhow, and all you
are doing is making it harder for the other folks.
A QSL card will be issued if you appear in the "heard"
list on the TNC.

N5QWL will be asleep over most USA passes, and N5RAX will
be busy with assigned duties for most daylit US passes, so
if the sun is up, try SAREX on packet. The Shuttle crew
will try to work voice (1) when we are not otherwise engaged,
and (2) at night or when the ground is cloudy (we are
generally busy taking pictures of the Earth during clear
daylight passes).

If Jay Apt can get to it, he will activate the SAREX about
3 hours into the mission.

QSL via: ARRL, ATTN: STS-59 QSLs, 225 Main Street, Newington, CT 06111,
USA. Include a self-addressed stamped envelope (SASE). Non-US
stations include a self addressed envelope with $0.50 of US
postage affixed or appropriate IRCs. Include the Callsign worked,
Date, UTC, Mode, and Frequency. For packet contacts, include the
QSO number issued by the robot. SWL QSL's: Include the Callsign
heard, Date, UTC, Mode, and Frequency.

481. Greenland to Maryland?

Newsgroup: rec.radio.amateur.space
Date: 1994-04-08 02:52:07 UTC
From: mitchell@aol14.wff.nasa.gov
Message-ID: <2o2gsn$1r9@paperboy.gsfc.nasa.gov>
Source record: 27835

...i never thought to look here, but when i read David Kurth's post in the hp48 group...

Based on the great experiences of everyone here, what are the chances that someone in Thule, Greenland would have to talk to someone in Maryland via 2m/70cm satellite? Is there one that would be in range at both places at the same time (for more than, say, 2 seconds)? Is Thule to far north for anything? What about packet?

I'm just looking for general thoughts...

Thanks,

Richard "being sent to the cold north for spring" Mitchell

486. Re: Greenland to Maryland?

Newsgroup: rec.radio.amateur.space
Date: 1994-04-08 12:16:19 UTC
From: ae517@FreeNet.Carleton.CA
Message-ID: <Cnxwr7.Ln8@freenet.carleton.ca>
Source record: 27840

In a previous article, mitchell@aol14.wff.nasa.gov (Richard Mitchell 1026) says:

>Based on the great experiences of everyone here, what are the
>chances that someone in Thule, Greenland would have to talk
>to someone in Maryland via 2m/70cm satellite? Is there one
>that would be in range at both places at the same time (for
>more than, say, 2 seconds)? Is Thule to far north for anything?
>What about packet?

I assume you are speaking of mode B (or mode J, for that matter)
satellites other than AO-10 and AO-13, which should fill your requirements
quite nicely.

Well, all of the packet satellites should work just fine. I recall seeing
ve8dx up in Pond Inlet on the KO-23 queue. He's roughly the same
latitude, give or take a few degrees. I think I've even heard him on RS-10.

487. Building Sat antennas

Newsgroup: rec.radio.amateur.space
Date: 1994-04-08 15:28:09 UTC
From: JAY@medicine.dmed.iupui.edu
Message-ID: <JAY.17.2DA57809@medicine.dmed.iupui.edu>
Source record: 27841

I am new to satelite communications. (This is just a warning!)

I would like to build a 2m & a 70cm beam for use with satelites. Does anyone know of an article in QST or some other plan for such antennas?
From what I understand, a normal 2m or 70cm beam antenna would work, but a circular polorization would be much better. I have no idea how one would build a circular polorized antenna.

Thanks
Jay KA9OKT

489. MONTHLY POSTING:Ham Satellite FAQ

Newsgroup: rec.radio.amateur.space
Date: 1994-04-08 17:33:21 UTC
From: stephen@hpdmlge.boi.hp.com
Message-ID: <CnyBFL.D2K@boi.hp.com>
Source record: 27843
Cross-posted to: rec.radio.amateur.space,rec.radio.info

REVISION: 8 APR 1994

CONTENTS:

Forward - my ramblings
Bibliography - list of sources and how to get more information
Modes - common satellite operating modes
Satellites - descriptions and background history of common satellite
Antennas - discussion of what works best
Preamps - discussion of what is needed
Rigs - popular satellite rigs and features
Accessories and Other Stuff - things that make satellte operation easier
Frequencies - list of most hamsats with uplink/downlink freq/modes

FORWARD:

Having recently started to get into Satellites, I asked MANY people what it took to get started and what to do. I found few people who could offer all the information necessary to start. I have attempted to compile this information for future newbies. If I have missed something, please ask and I will attempt to add it to the collection. Any comments can be sent directly to me, stephen@mail.boi.hp.com. Copies of this article should be available in the following locations:

oak.oakland.edu:/pub/hamradio/docs/faq
ftp.cs.buffalo.edu:/pub/ham-radio
Clear Skies BBS (608)249-7130

Also, if you really want to get serious about satellites, I would STRONGLY recommend joining AMSAT to help promote the satellite hobby. AMSAT is a volunteer organization that works for the interests of amateur satellites. Dues are only US$30 per year and you will receive a subscription to "The AMSAT Journal". For US$80, you will receive first year dues and a copy of Instant Track computer tracking software which is a top-notch program. Instant Track was donated to AMSAT by its author and its sales account for a considerable portion of AMSAT's income. AMSAT-NA, 850 Sligo Avenue, Silver Spring, MD 20910-4703. (301) 589-6062. Credit cards welcome.
NOTE: I am in no way connected with AMSAT-NA, other than I have found their publications quite useful.

BIBLIOGRAPHY:

The following text was compiled from the following sources and from comments from many operators:

* "How to use the EZSATS pass tables by N9LTD" reprinted with permission. Full text, tables, and lots of other useful information can be obtained by sending a SASE to David Mullenix N9LTD, 2052 Brentwood Pky, Madison, WI 53704 or call the Clear Skies BBS at (608)249-7130.

* "Amateur Radio Satellite Frequencies" This file can be obtained from the ARRL e-mail server. For information on the server, send an e-mail message to info-serv@arrl.org with 'HELP' in body of message.

* "Summary - Getting onto the Hamsats" This was an article posted to rec.radio.amateur.misc newsgroup by Stephan Greene (sgreene@access.digex.com) on 20 Mar 1992. The article is also available via anon ftp from ftp.cs.buffalo.edu or Australian mirror at grivel.une.edu.au as file pub/hamradio/ham_sat_sum.

* "An Amatuer Satellite Operation Upgrade Path" from the AMSAT Journal, September/October 1993, pp. 24-26.

MODES:

The combination of uplink freq, downlink freq, and transmission mode are all lumped together into standardized satellite MODES. Here is a list of common satellite modes used by satellites covered by this article:

A - This mode requires a 2 meter SSB/CW trasmitter and a 10 meter SSB/CW receiver and supports CW and voice.

B - This mode requires a 70 cm SSB/CW transmitter and a 2 meter SSB/CW receiver and supports CW and voice. Some satellites also support RTTY and SSTV in this mode.

K - This mode requires a 15 meter SSB/CW transmitter and a 10 meter SSB/CW receiver and supports CW and voice. This mode is unique in that it can be done with a simple HF rig.

JA- This mode stands for J Analog and requires a 2 meter SSB/CW transmitter and a 70 cm SSB/CW receiver and supports CW, voice.

JD- This mode stands for J Digital and requires a 2 meter FM transmitter and and a 70 cm SSB/CW receiver and supports packet.

S - This mode requires a 70 cm SSB/CW transmitter and a 2.4 GHz SSB/CW receiver and supports CW and voice. Many people use a 2.4 GHz to 2 meter converter with a 2 meter SSB/CW receiver instead of buying a 2.4 GHz SSB/CW receiver.

T - This mode requires a 15 meter SSB/CW transmitter and a 2 meter SSB/CW receiver and supports CW and voice.

Some satellites have dual modes that operate simultaneously. For example, AO-13 can operate in mode BS which means that it can do both mode B and mode S simulaneously. Other common dual modes are KT and KA.

Also, satellites have 3 basic types of retransmissions: beacon, transponder, and repeater.

Beacon - Most satellites have a fixed Morse beacon at the lower end of the satellites band-pass transponder. This is useful to detect when the satellite has crossed the horizon and is in range for operation. It can also be used to determine dopler shifts.

Transponder - A transponder is a band-pass repeater. It accepts a range of frequencies on the input and retransmits the entire range on the output. All offsets withing that range are preserved. NOTE: since the satellite is transmitting many signals at the same time, it is dividing its output power amongst all of these signals. If someone transmits a very powerful signal into the satellite, it will spend most of its power retransmitting that signal and all of the other signals will drop in power. This is NOT a way to earn friends and people who overpower the satellites input are called "alligators" and are not very popular.

Repeater - This closely resembles a land-based repeater. It listens for signals on one frequency and retransmits it on another frequency. All satellite repeaters (and transponders) are full duplex, meaning you can (and should) listen to you signal on the downlink (with headphones) while you are transmitting.

SATELLITES:

Some satellites are easier to work than others. The satellites that follow can be operated fairly easily and are referred to by some as the Easy Sats. What follows is a breif description of each satellite. A summary list of operating frequencies is included later.

Mir

Mir (promounced "mere" - "Peace" in Russian) is the Russian Space Station. It's been in orbit since 1986. All recent Russian Cosmonauts have been hams and have callsigns with "MIR" in them, such as U2MIR. Mir has 2-meter equipment on board and they operate packet and voice on 145.55 MHz. (This is the same freq as the Space Shuttles.) The cosmonauts also have a digital voice recorder which can repeatedly transmit voice announcements.

The best way to get a QSL card from Mir is to connect to their TNC's mailbox, R0MIR-1, (That's R Zero MIR) leave a message AND GET A MESSAGE NUMBER. You must have the message number to qualify for a QSL. The TNC is often busy because amatuers forget to disconnect before Mir goes under their horizon. In a case like this, try connecting to yourself or a friend VIA R0MIR. And if you hear a heavily accented voice calling CQ, by all means say hello!

70 cm and ATV gear is being prepared for future flights!

QSL Address:
Sergei Samburov (RV3DR)
Prospect Kosmonavtov. d.36, kw.96
Kaliningrad City, MOSCOW 141070, RUSSIA.

Sergei can also be reached via packet radio as RV3DR @ RK3KP.#MSK.RUS.EU

A special note on caculating Mir's orbit: Mir is big and it's in a low orbit. This means that there's a lot of atmospheric drag and it has to fire

its rockets every month or two to boost itself back up or it would have re-entered and burned up long ago. Unfortunately, whenever this happens, it throws off all pass predictions. When this happens, Mir will arrive LATER than predicted, so if you tune to 145.55 and nothing happens at the predicted time, keep waiting, it may be along in 10-30 minutes.

SEEING MIR: Mir is also the only EZSAT that can bee seen. Mir is very big, about the size of a semi-trailer, and when it comes over just after sunset or just before sunrise, you can often see it go by. This is because Mir will still be in sunlight whil you're in the earth's shadow. In these cases, Mir looks like a very bright star gliding acress the sky. It's a beautiful sight and well worth looking for. It's best to use a tracking program set to VISUAL to find visible passes. The best such programs will even draw you a star map and show you Mir's path across it. Don't forget to tune to 145.55 when you see it. Also, don't forget to get on the local repeater and tell people when you spot it so that others can share in the fun.

RS-10/11, RS-12/13, OSCAR-21(RS-14)

These three satellites are all in 600 mile high polar orbits, which carry them over the US six to eight times a day for 10-18 minutes at a time. They all have orbital periods of about 95 minutes and we typically get two sets of three or four passes spaced 95 minutes apart. The two sets of passes are spaced 12 hours apart and their passes come a little earlier each day because their orbits don't take quite exacly 95 minutes.

These satellites all have a coverage circle about 4000 miles in diameter, so when they're about the horizon, you can use them to work hams anywhere in the conteinental US, Canada, Alaska, Mexico, Central America, South America down to the Equator, the Caribbean, Greenland, Iceland and parts of Scandinavia. Eastern hams can work Europe and the West can work Hawaii.

All of these satellites are in boxes that are bolted to larger Russian satellites and draw their power from the large satellite's solar cells. They are VERY easy to hear and fairly simple to work.

OSCAR-21

My favorite satellite. This is a German/Russian radio that uses a Digital Signal Processor (DSP) chip and it is Flexible with a capital "F"! It was launched in January, 1990 configured as a linear translator which received a band of 70 cm CW and SSB signals and relayed them on 2 meters. The bird was, to put it mildly, under-utilized. Then in 1992 the DSP chip was reprogrammed in orbit into a cross band FM repeater! If you've been wondering if DSP is as powerful as you've heard, now you know! In the past year, it's telemetry has been re-programmed from an obscure format to standard 1200 baud packet. WEFAX pictures (which are uploaded by teh ground controllers) were added in December 1993. (This is the same format used by many weather sats and short wave weather stations.)

OSCAR-21 has an input frequency of 435.016 MHz, but 435.015 works just fine. It's output frequency is 145.987 MHz, but 145.985 or 145.990 will recieve it quite well. It has a strong transmitter and a ground plane antenna and most

HTs have no trouble picking its signals up when it passes over. Mobiles and base stations with omni antennas will receive it full quieting. You can get into this bird with 20 watts and a six element beam antenna. I mount my beam on a photo tripod next to my car and run coax to my dual band mobile. You have to point the beam accurately, so I take a list of altitude and azimuth bearing generated by simple tracking software out with me and re-point the beam once a minute. In one summer, I worked the east and west coasts, several Canadians, Texas and Guantanamo Bay, Cuba before fall's cold weather drove me indoors.

Some OSCAR-21 tips: you can hardly get a word in edgewise during "prime time" opening passes. Try the late night passes instead, they're much less crowded. OSCAR-21's transmit and recieve polarity rotate constantly during a pass. Mount your beam so you can easily rotate it for the best signal. Remember, all these ham sats are full duplex, so you can and should monitor your signal on the downlink. (Use headphones.) Turn the beam for minimum noise. You'll probably have to modify your dual band rig to get it to transmit on 435.015. BE CAREFUL beacuse FM is generally NOT appreciated below 440 MHz. Also, the mod may allow you to transmit out of band, which is a real no-no.

OSCAR-21 is also known as RS-14, AO-21 and Rudak-2. It's bolted to a satellite called INFORMATOR-1, which is often abbreviated INFORMTR-1. It's NORAD ID number is 21087. Be careful, the rocket booster that launched the satellite is still up there and it's named INFORMTR-1 R/B in some element sets. Your tracking program may find it instead of the satellite if you're not careful.

RS-10/11

This is probably the easiest satellite to work of them all. It has an incredibly sensitive receiver that can pick up the faintest two meter signal and relay it on ten meters. There are documented examples of people having QSOs on RS-10/11 by clicking Morse on HTs with rubber duck antennas! I guarantee you that your HT can put a useable signal into RS-10/11, I've done it myself. WARNING: if you try this, disable the microphone so you don't transmit any FM sidebands and turn your CTCSS (PL) OFF!

RS-10/11 (Radio Sputnik) is for CW and SSB signals, so an all mode 2 meter rig is ideal for transmitting to this bird. The input bandpass is from 145.860 - 145.900 and the output freqs are from 29.360 - 29.400 MHz. There is also a morse beacon at 29.357 MHz.

RS-10 is also equiped with a feature called ROBOT. The ROBOT is an automatic on-board QSO computer. To work it, send the following at about 15-20 wpm on 145.82 MHz (an automated keyer works best):

RS-10 DE (your call) AR

If the ROBOT hears you, it will respond on the 29.403 MHz downlink with:

(your call) DE RS-10 QSL NR (number) OP ROBOT TU USW QSO (number) 73 SK

If you want a QSL card, try sending the QSL number the ROBOT sent back to you on your QSL (along with an SASE and return postage) to:

Andrey Mironov
UL Vvoloshinoj. D11. KV72.
141000 Station Perlovskaya
Moscow, Russia

RS-12/13

A cousin to RS-10/11, RS-12/13 is also a 40 KHz wide linear transponder. However, this bird is unique because its input frequencies are in the fifteen meter band! This is also the only ham sat in the sky that requires more than a code free technician license to work it, because its input band is from 21.210 - 21.250 MHz. This straddles the Advanced and Extra portions of the 15 meter band. Its output freqs are from 29.410 - 29.450 MHz. Because of skip, this satellite can often be heard and worked when it's below the horizon! At least one person has earned DXCC on this satellite! RS-12/13 is bolted to yet another Russian satellite and its NORAD ID is 21089. RS-12/13 also has a ROBOT mode like its brother RS-10/11.

DOVE

DOVE is short for Digital Orbiting Voice Encoder and is a transmit-only hamsat (it has no user accessible receiver). Built in Argentina, DOVE was launched in 1990 as a good will satellite to introduce children and newcomers to amateur satellites. It was originally intened to transmit digitized voice messages that could be picked up by students with simple receivers. Unfortunately, the digital voice hardware and software has been a constant source of problems since launch. Atempts to get DOVE to works properly are proceeding as this is written, so the best bet is to tune your 2-meter rig or scanner to 145.825 MHz and see what the bird is up to currently. Be ready for Morse, standard 1200 baud packet or (with luck) digitized voice messages. The signals are strong enough so that an HT with a rubber duck will hear it when it's overhead, although ground plane antennas will give better coverage when the bird is near the horizon.

AO-10

Known as Phase 3-B before it's launch by the European Space Agency in June, 1983, this satellite was designed for launch into a high elliptical orbit. This orbit, called "Molniya" orbit, places the satellite over one spot on the Earth for up to several hours at a time. This orbital configuration also allows for consistent, long haul DX communication because the satellite is visable to roughly half the Earth! This orbit virtually eliminates the frantic "hurry up" style of operation. But such a luxury is not without cost. At the farthest point in the Molniya orbit, this satellite is over 25,000 miles away from the Earth, meaning high gain antennas and higher power levels are required to get a workable signal up and through the bird. Also, even though radio waves travel at the speed of light, the over 50,000 mile round trip creates a signal path delay of about 1/4 second on the downlinked signal. It takes some time for satellite operators to get used to simultaneously speaking and listening to their own voices returning in

their headphones a quarter second later.

The first Phase 3-A launch ended in disaster when the Ariane booster malfunctioned, dropping the bird in the Atlantic. Phase 3-B, later to become OSCAR 10, met with somewhat better fortune, surviving the launch and first burn of its "kick motor" just fine. However, we later learned that the booster had apparently bumped OSCAR 10 shortly after separation which damaged one or more of its antennas and also caused other internal injuries because the second and subsequent kick motor firings never happended. This left OSCAR 10 in a lower inclination elliptical orbit. This meant that the bird didn't have the intended operational coverage nor enough solar panel illumination to sustain full operations. So today, OSCAR 10 is "sort of" operational. It is stuck in mode "B" with only its omnidirectional antennas working and it is slowly tumbling. Users are requested to listen for AO-10's 145.810 MHz beacon for a steady, unmodulated carrier before operating the bird. If the beacon is raspy or if your downlink signal appears to be shifting in frequency, users are asked NOT to use the transponder until it has a chance to slowly recharge its batteries.

AO-13

Launched in June, 1988, OSCAR-13 is now carrying the bulk of the long haul DX available via amateur satellite. It is the current--and much improved--brother to OSCAR 10. However, unlike OSCAR 10, it did managed to achiieve its "Molniya" orbit. OSCAR 13 also has the ability to automatically select transponders for each mode at different points in its orbit. This helps optimize the mode in use with its corresponding downlink antenna gain. OSCAR 13 did have some problems, however. It had a RUDAK experiment onboard that failed shortly after launch. Also, in June 1993, the 70 cm downlink transmitter ceased to function, putting an end to Mode J and L operation. However, modes B and S are still being supported and mode S is becoming increasingly popular. Also, AO-13's batteries are beginning to show signs of age and its orbit it deteriorating. The progressive effects of previously unknown gravitational interactions between AO-13, the Sun, the Moon and the Earth will all conspire to cause the satellite's re-entry into the atmosphere sometime in 1996.

ANTENNAS:

For AO-13, the consensus is get to get KLMs, Telex/Hy-Gains, or roll-your own, Nobody liked the Cushcraft satellite antennas - they appear to have problems in wet weather. Bigger is also better, if you have the space. Several people mentioned the KLM 22C and 40CX pair as excellent performers (again - you need the room for those long booms!) KE4ZV stated his pair of KLMs (the big ones!) lets him work AO-13 with 3 to 30 watts (hardline feed and rigorous attention to routing the feedlines and cables properly to maintain the antenna patterns helps, too.). Others mentioned the KLM 14C/18C pair as good performers - but you need more power on the uplink.

Telex/Hy-Gain antennas were recommended by several people as a less expensive alternative to KLMs that work almost as well. There's also M2 (started by an engineer from KLM). While no one who responded uses them,

the information I received from a call to their factory in California suggests they are comparable to slightly better than the KLMs in performance, and about the same in cost. Dave, WB6LFC, said homebrewing antennas is also feasible - it takes work, but attention to detail results in top-notch performance for very little money. Finally, Ross, VE6PDQ, reported good results using a pair of Cushcraft 215WBs on receive.

Problems encountered with AO-13 antennas include routing cables and feedlines off the back of the antennas (to preserve antenna patterns), use of fiberglass cross booms, mounting preamps as close to the feedpoint as possible, and long antenna booms drooping. (Gary, KE4ZV, recommends using a rope to brace the boom or stiffening booms and fiberglass masts internally with foam-in-a-can insulation.)

On antenna rotators, it appears the Alliance UD-100 is no longer made, though it should still show up at hamfests. People with long-boom antennas report the Alliance rotator is too weak to move a big array anyway, and recommended Yaesu's elevation-only rotator or their Model 5400 azimuth-elevation unit.

Antennas for the low-altitude satellites appear to be much less critical. J-poles were most frequently mentioned (the design from the AMSAT Journal?), but dipoles, ground-planes, and yagis are also in use. Several people work RS-10 quite well with antennas in the attic. Best results are with steerable antennas, but the high operator workload during a pass (unless the satellite is just grazing your access circle) almost demands computer control of the rotators.

PREAMPS:

You need a preamp for AO-13. (I can hear the downlink after a fashion on a Ringo fed with cheap coax and a 10 dB preamp in the shack, but it's not communications quality reception!) Only two people mentioned a specific brand name (Advanced Receiver Research and the unit included with the Ten-Tec 2510), so I assume almost any GAsFET preamp in the 20dB gain class is adequate. THE PREAMP MUST (almost always) BE MOUNTED AT THE ANTENNA (check the discussion in Chapter 9 of the Satellite Experimenter's Handbook and you'll see why!). KE4ZV recommends mounting the preamp AT the antenna feedpoint, if your elevation rotator can handle the unbalanced load.

While no one mentioned it (maybe it's obvious), if the antenna is used to transmit (say Mode J) as well as receive (on Mode B, for example), the preamp MUST either include RF-sensed switching, or be switched out of the line before you transmit. TRANSMITTING INTO AN UNPROTECTED PREAMP WILL DESTROY IT INSTANTLY!

Preamps also seem to help on RS-10 (especially with older HF rigs) and on the Pacsats. It seems to be a case of "try it, and get a preamp if it looks like it would help").

RIGS:

Three radios were mentioned by name - Yaesu FT736 (and it's predecessor, the 726 with satellite module), Kenwood TR751 (a mobile-capable 2 meter multimode), and Ten-Tec's 2510. The Ten-Tec unit is out of production. The few units left are selling for about $300-350. I'm sure other multi-mode radios, and setups with converters and transverters work well, too - it's just that no one mentioned any by name.

Power output required is a function of the satellite, your antennas, and how badly you want to communicate. [QRP on the satellites is just like QRP on HF - you need good antennas and feedline, you have to pick optimal passes, and skilled operators at both ends are needed. Given the apparent "calmer" operating style on AO-13, QRP is probably easier there than on 20 meters!]

Anyway -about power for AO-13. 3-30 watts will work if you have top-notch antennas (KE4ZV). KC7IT uses 50-100 watts (Ten Tec 2510, Mirage D1010 amplifier, KLM 14C/18C fed with 50 feet of 9913). Both KE4ZV and KC7IT use Mirage D1010 amplifiers on 70 cm when they need a little extra power. For an "optimum station", WA5ZIB recommends 60 watts on 70 cm and 80 watts on 2 meters for AO-13, assuming good antennas (Telex/Hy-Gain or better) and feedlines, and 20 watts to a 5' dish for Mode L. Andy emphasized that you can get by and have lots of fun with much less!

For Mode A, WA5ZIB said 6 watts to the AO-13 2 meter antenna will work well. People using omnis report success with the Pacsats running 50-70 watts to a J-Pole (N5VGC). Several people said they (or someone they know) have no trouble using RS-10 at lower power (10-25 watts) with simple, omnidirectional antennas. Again, it's a case of "try it and see if it works."

There was unanimous consensus that the receiving quipment (antenna, preamp, feedline, and receiver) is more important than the transmit equipment. Running more power "to hear yourself" is frowned upon, to say the least! It's also important to be able to vary uplink power to adjust to specific conditions. Both the Ten Tec 2510 and the Yaesu 736 have continuously variable power output (I guess the rest of us just have to fiddle with the drive controls on our rigs!).

ACCESSORIES AND OTHER STUFF:

You need a PSK modem to use the Pacsats. PacCom makes fully assembled units, either already integrated with their own TNC, or as a board you install in your TNC-2 clone. They make similar 9600 bps units for accessing UO-22. The downlink receiver (on 70 cm) should be capable of being tuned by the PSK modem's AFC lines. Newer radios can use the up/down lines from the microphone jack or an accessory connection on the rear panel. Older radios must be modified, or be tuned manually. N5VGC told me he sees about 20KHz of doppler on an AO-16 pass, and that without automatic tuning, operator workload is too high to do much else besides tune the receiver!

Just about any radio suitable for packet on 2 meters will work for AO-16, WO18, and LU-19. To run 9600 bps on UO-22, modifications to bypass the microphone and speaker's audio processing circuits are required. I've seen some reports on rec.radio.packet and in the various Hamsat columns that

differences between UO14 and UO-22's transmitters make UO-22 more difficult to copy. (I'll worry about that problem later - I'll start with AO-16 and LU-19 first!)

No one mentioned computers - again, it must be obvious (also, we're "talking" using computers!). They're handy, and you need one IN THE SHACK when working the Pacsats or for automated, real-time control of antenna rotators (useful for low altitude satellites).

Other operator aids mentioned, or I thought of on my own: If your radio can't slave uplink and downlink tuning (Ten Tec 2510 and Yaesu 736 can), you need something to help convert between uplink and downlink frequencies (and account for doppler shift and calibration errors on the radios' frequency readouts). A cardboard slide scale or dial will work. I'm thinking of programming my HP48 to do the conversion for me. You need something like this to know where to tune on the uplink to hear a given downlink frequency.

Software to track satellites and predict passes. There are many programs that work. Price ranges from free to $70 for state-of-the-art QuickTrack or InstantTrack (available from AMSAT). Special software is also needed to use the Pacsats, and to interpret telemetry data. This software is also available from the usual ham sources, and from AMSAT (BTW, software sales support the amateur satellite program!)

Polarity switchers optimize antenna performance by allowing switching antenna feeds from RHCP to LHCP as the need arises. They are a very useful add-on, but don't appear essential.

Equipment to measure power output, SWR, transmit frequency - all useful (see - satellites are not that different from HF!).

>What about packet?

Try one of the satellite tracking programs like instant track.
It shows the visibility of a satellite on a map of the earth.
All stations inside this circle have the chance for a qso...

>know of an article in QST or some other plan for such antennas?

Get the ARRL &/or RSGB antenna handbooks. THe calculations for a helix are trivial. They are wideband and non-critical in dimensions, unlike a yagi.

However people don;t build them at 2m very often - they are more often used at UHF . I don't really know why but here are some guesses

A 2m helix is large and hard to support (rods out from the center pole to the helix are long).

It isn't 50 ohms. Itsa bout 140ohms and there are tricks to make it 50ohms but these are narrow band (still wide band by ham band standards) and a little tricky to get going.

Maybe you can make more money by selling a yagi than a helix.

It would beinteresting to find out the real reason, but most people if they want a fair bit of gain at 2m and 432 and want circular polarisation they use crossed beams 1/4lambda apart

>From what I understand, a normal 2m or 70cm beam antenna would work, but a
>circular polorization would be much better. I have no idea how one would

Use your nearest archie server. Ask someone who understands the network on your local node or go

man archie

at the prompt (if you're on a unix machine)

495. Two-Line Orbital Element Sets (TLE373)

Newsgroup: rec.radio.amateur.space
Date: 1994-04-09 00:06:02 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.765849962@afit.af.mil>
Source record: 27849

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

SB SAREX @ AMSAT $STS-59.004
STS-59 SAREX Mission Underway

Greenbelt, MD April 9, 1994 at 12:00 UTC

The Space Shuttle Endeavour rose into the early morning skies of the Kennedy Space Center this morning, initiating the flight of STS-59. The spectacular, on-time launch occurred precisely at 11:05 UTC (7:05 EDT). Therefore, element set JSC-009, distributed yesterday, should be valid for the first flight day. For your convenience, this element set is provided below.

The Shuttle Amateur Radio Experiment (SAREX) was activated approximately 3 hours after liftoff with an excellent check pass through San Diego. Kerry Banke, N6IZW and Ron Earl, W6TXK, in San Diego used a phone link to connect Jay Apt, N5QWL on the Space Shuttle Endeavour with Lou McFadin, W5DID at the Johnson Space Center. The SAREX equipment appears in good shape and ready for packet operations. During the contact, Jay Apt said he really enjoyed the magnificent ride into space. More details will follow as they become available.

SB SPACE ARL ARLS016
ARLS016 SAREX Mission STS-59

SAREX Mission STS-59

The Johnson Space Center Amateur Radio Club will manage a small dial-in telephone BBS during the upcoming SAREX Shuttle mission. The BBS will have the latest Keplerian element sets available during the flight. The number is 713- 244-5625, 9600 baud or less.

Additional Shuttle mission information will be available throughout the flight from the NASA Spacelink computer bulletin board. To reach the bulletin board, dial 205-895-0028, or on internet use the address spacelink.msfc.nasa.gov.

The flight is scheduled to launch at 1206 UTC on Friday, April 8. Amateur Radio licensed crewmembers Jay Apt, N5QWL, and Linda Godwin, N5RAX, will operate the Shuttle Amateur Radio EXperiment. Apt is the commander of the Blue Shift and will operate the shuttle systems during the ''night'' shift, while Godwin is responsible for overall operation of three large radars in the shuttle's cargo bay during the ''day'' shift. They will operate both FM voice and packet during the mission.

Keep posted to W1AW bulletins for additional SAREX information and updated Keplerian element sets throughout the flight.

Thank to Gil Carman, WA5NOM, and the Johnson Space Center Newsroom for the preceding information.

ARLS017 Shuttle launch delayed

Shuttle Launch Postponed 1 Day

Friday morning's scheduled launch of the Space Shuttle
Endeavour has been postponed due to weather constraints
until Saturday, April 9 at 1105 UTC.

This mission, designated STS-59, carries the Shuttle
Amateur Radio EXperiment or SAREX. Astronaut Jay Apt,
N5QWL, will try to activate SAREX about 3 hours into the
mission. Stay tuned to W1AW for additional launch and
mission information.

502. OSCAR MODE S

Newsgroup: rec.radio.amateur.space
Date: 1994-04-10 08:40:56 UTC
From: wb8k@barf80.nshore.org
Message-ID: <Xy6Jkc1w165w@barf80.nshore.org>
Source record: 27856

Anyone know of an inexpensive (less that the $300+ commercial converters)
way to get on Mode S. How about converting some of the TVRO LNA/B's down
in freq??

Dennis jakubisin

503. Oscar Antennas ??

Newsgroup: rec.radio.amateur.space
Date: 1994-04-10 08:43:16 UTC
From: wb8k@barf80.nshore.org
Message-ID: <T36Jkc2w165w@barf80.nshore.org>
Source record: 27857

What the latest gossip concerning what good & what isn't on Oscar yagi's
for mode B & J.. KLM, M sqrd etc. Any comments?? The old Cushcraft AOP 1
pkg I have been using for a few years rally barks, especially in wet
weather.
/e

> Anyway, I downloaded the program sattrack for my UNIX box at home and
> compiled it under linux. Everything went okay until I tried the
> program. The program kept on telling me that the satellites have
> "crashed already".

> I tried AO-21, Mir and Oscar 13, they all gave me the same result, and
> I know, for a fact, that the satellites have not been crashed :-).

> Please help me, thanks in advance.

> 73 de KE6BCU, Benjie

What you have is SatTrack V1.0. This version was the very first version and was meant to be distributed locally in Berkeley and Stanford for testing purposes only and is known to have bugs. Since then there have been many upgrades and modifications. The last publicly released version of SatTrack is V1.7. Bob Kupiec was kind enough to provide an FTP site from which it can be obtained. It's now available on ftp.jvnc.net in /priv/kupiec.

Uncompress the distribution file by typing:

uncompress sattrack.V1.7.tar.Z

Then unbundle the distribution file by typing

tar xvpf sattrack.V1.7.tar

If SatTrack is compiled on a Linux machine with a Gnu C compiler, the Makefile needs to be changed. Replace the 'cc' everywhere with 'gcc'. This worked fine on a Toshiba T4600C laptop with Linux.

SatTrack has no graphics, but a live display mode and orbit prediction features. In the meantime, I spent quite some more time to work on the program and also incorporated numerous suggestions from users all over the world. The new version (V2.0) is not quite ready to be publicly released, but I hope I can check the program some more during the next six weeks or so. It will feature the SGP4/SDP4 NOARD models, a live display for a single satellite as well as a live display for multiple satellites (as many as the computing power of the machine it runs on allows), a batch mode with arguments passed on the command line, and the orbit prediction capabilities that V1.7 had. There are more improvements like the calculation of squint angles (for AO-10 and AO-13), and also some subroutines that allow control of ground station equipment, like radios and antenna controllers. The framework for the latter are part of SatTrack V2.0 and easily be configured by the user for specific hardware.

Stay tuned...

(Remark: There is a program SatTrack for PCs which has nothing to do with this Unix/C program. Two different programs from two different authors.)

SB SAREX @ AMSAT $STS-59.008
STS-59 World R/S Times 04/09

Below are the rise and set times for STS-59 for selected worldwide cities
over the next three days. This data was generated to help hams without
orbit programs to participate in the SAREX activities. Please note that
the times shown are UTC and NOT LOCAL TIME. This listing includes only
those passes with an elevation greater than 5 degrees. For information
regarding SAREX frequencies and operations procedures, check your
local PBBS, or bulletins from W1AW, W5RRR, W6VIO or WA3NAN.

Symbol key: rise = time that shuttle appears above horizon
tca = time of closest approach to observer
set = time that shuttle disappears below horizon
el = maximium elevation above horizon
geo = geometry: A = Ascending orbit, moving south to north
D = Descending orbit, moving north to south
E = passes east of observer
W = passes west of observer

Cross-posted to: rec.radio.amateur.space,rec.radio.info

SB SAREX @ AMSAT $STS-59.009
SAREX Update & Keps 4/10/94

Greenbelt, MD, April 10, 1994 at 16:00 UTC

After the successful check pass yesterday, the SAREX Working Group has had several reports of packet radio operation and some general voice QSO operation during the Shuttle passes over the U.S. In addition, the St. Bernard High School in Playa Del Rey, CA had a very excellent school group pass this morning (Rev 19). A total of seven questions were asked by the students.

The official SAREX element set for today will be GSFC-007. This element sent was generated by Ron Parise, WA4SIR of the Goddard Space Flight Center. Gil Carman, WA5NOM reports that the predictions using GSFC-007 differed from JSC-009 by approximately 20 seconds. GSFC-007 follows:

STS-59
1 23042U 94020A 94100.26164012 0.00018681 11051-4 10679-4 0 75
2 23042 56.9969 260.0497 0009381 274.0340 85.9677 16.20558915 145

Satellite: STS-59
Catalog number: 23042
Epoch time: 94100.26164012 (10 APR 94 06:16:45.71 UTC)
Element set: GSFC-007
Inclination: 56.9969 deg
RA of node: 260.0497 deg Space Shuttle Flight STS-59
Eccentricity: 0.0009381 Keplerian Elements
Arg of perigee: 274.0340 deg
Mean anomaly: 85.9677 deg
Mean motion: 16.20558915 rev/day Semi-major Axis: 6596.1671 Km
Decay rate: 0.19E-03 rev/day*2 Apogee Alt: 223.97 Km
Epoch rev: 14 Perigee Alt: 211.59 Km

NOTE - This element set is based on NORAD element set # 007.
The spacecraft has been propagated to the next ascending
node, and the orbit number has been adjusted to bring it
into agreement with the NASA numbering convention.

Submitted by Frank H. Bauer, KA3HDO for the SAREX Working Group

Hello, My name is Mike Johnson. I am looking for a source for
USSPACECMD/NORAD type 2 line element sets for a varity of vehicles (primarily
16609).

Any help in finding this (these) source(s) would be greatly appreciated.
I can also be contacted at johnsonm@Rush.aps.rl.af.mil

Thank you for your time.

W5RRR/JSC ARC LANDLINE BBS

HR AMSAT NEWS SERVICE BULLETIN 099.01 FROM AMSAT HQ
SILVER SPRING, MD APRIL 9, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-099.01

New Landline BBS Provides STS-59 SAREX Information

The Johnson Space Center Amateur Radio Club has set up a telephone computer bulletin board (BBS). The purpose of the BBS is to provide a source of current Space Shuttle mission Keplerian Elements.

There are limited number of BBS files available for downloading. Among the current files are:

o Current and old element sets for the mission in progress
o Current mission information
o Shuttle Amateur Radio Experiment (SAREX) information
o Recent Space Shuttle Mission Schedules and Manifests
o Astronaut/Cosmonaut Ham List
o Current JSC Amateur Radio Club Newsletter

We ask that no files be uploaded to the BBS. The telephone number is (713) 244-5625. Our modem can handle all bauds up to and including 9600 baud. The parameters are N-8-1.

The BBS is currently running in ProComm HOST mode, so the logon is very simple and downloading is easy. After logging in, you will see the Welcome Screen describing the BBS. Also, the Welcome Screen contains the current and latest element set number (e.g., JSC008) loaded on the BBS. Check it against your last set so you won't waste your time duplicating a set you already have. Press ENTER to bring up the second page containing the current Space Shuttle Keplerian Element Set. If you have a file capture or screen capture function in your communications software, then you should use it for this page. That way, you won't have to go through the file download process if all you wanted was the latest element set. If you have any comments for the Club or BBS sysop, leave a message and we will respond.

[The AMSAT News Service would like to thank Dale Martin (KG5U), KG5U @ KA5KTH.#setx.tx.usa.na, Secretary of the Johnson Space Center ARC Houston, Texas (W5RRR)]

FUJI AWARD PROGRAM DETAILS

HR AMSAT NEWS SERVICE BULLETIN 099.02 FROM AMSAT HQ
SILVER SPRING, MD APRIL 9, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-099.02

JJ1WTK Provides Information About "FUJI" Award

Amateur Satellite "Fuji", SWL Amateur Satellite "Fuji" applicants are required to make contacts with 10 different amateur stations through the amateur radio satellite "Fuji" (only contacts in CW or SSB mode), and obtain the QSL cards from those stations. This award applies for both FO-12 (JAS-1) which was launched at 20:45 UTC in 12-AUG-1986 and JAS-1B which was launched on 07-FEB-1990. Any contact thru FO-12 or FO-20 is good for the "Fuji Award" application. A fee of 8 IRCs or US $4 will be charged per award. An additional 2 IRCs will be charged for air mail delivery regardless of the number of the awards claimed. If QSL cards are submitted, sufficient funds for return postage will also be required. All correspondences should be sent to:

Japan Amateur Radio League - Award Desk,
1-14-2 Sugamo, Toshima, Tokyo 170, Japan

[The AMSAT News Service would like to thank Kazu Sakamoto (JJ1WTK) for this bulletin item. JJ1WTK can be reached at his e-mail address of qga02014@niftyserve.or.jp]

CT1ERC Reports POSAT-1 Voice Contacts Made

CT1ERC reports that a special event amateur satellite station, CU2APO, was setup on the island of San Miguel in the AZORES for a technical exhibition to a youth grounp using POSAT-1. This demonstration was arranged by the PoSAT Consortium in which they agree to switch the satellite to operate on the amateur frequencies and it was configured as a FM transponder for a single pass to allow voice contacts between this island in the middle of the Atlantic ocean and the continent. Everything was arranged overnight and on short notice so unfotunately there was not enough time to send out notices of this event for other radio amateurs to participate. However, CT1ERC wishes to pass allong his report of the this first time voice contact on POSAT-1.

"The uplink frequency was 145.975 MHz and the downlink frequency was 435.275 MHz which by coincidence is a frequency with alot of strong QRM at CT1ERC's QTH. At 12:28 UTC 24-FEB-1994, with the satellite heading from North, the mutual window between CT1ERC's station (located in the extreme North of Portugal) and CU2APO (located in the extreme West, half way to N. America) opened and he exchanged a QSO with Pedro Carvalho (CT1DBS). The reports were both S59 but only for short periods, due to the strong bursts of QRM which made communication very difficult. One minute later there appeared Miguel Gomes (CT1EVH) operating the club station CS1APO located in Lisbon and Artur Gomes (CT1DIA) located in Faro (extreme South of Portugal). The QRM affected all stations except CT1DIA who have copy all of us during the whole pass with reports between S57 and S59. Sometimes during the pass two Spanish stations, apparently mobile, in a QSO on the VHF band were completly unaware that they were using a satellite uplink and reaching the downlink with S55 to S57."

CT1ERC wants to thank to the the Consortium for made the satellite available for 10 minutes and to Pedro, CT1DBS, for all his efforts and hours spent in convencing the POSAT Consortium to allow this demonstation to happen.

[The AMSAT News Service (ANS) would like to thank Jose Carlos (CT1ERC) for this bulletin item.]

SB SAT @ AMSAT $ANS-099.04
AO-13 OPS NET SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 099.04 FROM AMSAT HQ
SILVER SPRING, MD APRIL 9, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-099.04

Current AMSAT Operations Net Schedule For AO-13

AMSAT Operations Nets are planned for the following times. Mode-B Nets are conducted on AO-13 on a downlink frequency of 145.950 MHz. If, at the start of the OPS Net, the frequency of 145.950 MHz is being used for a QSO, OPS Net enthusiasts are asked to move to the alternate frequency of 145.955 MHz.

Date UTC Mode Phs NCS Alt NCS

18-Apr-94 0100 B 188 W5IU WA5ZIB
23-Apr-94 1800 B 180 VE2LVC W9ODI
30-Apr-94 2130 B 176 W9ODI VE2LVC
09-May-94 0000 B 175 W5IU WA5ZIB
14-May-94 1700 B 167 WA5ZIB W5IU
21-May-94 2130 B 185 VE2LVC W9ODI

Any stations with information on current events would be most welcomed. Also, those interested in discussing technical issues or who have questions about any particular aspect of OSCAR statellite operations, are encouraged to join the OPS Nets. If neither of the Net Control

Stations show up, any participant is invited to act as the NCS.

Slow Scanners are invited to join the SSTV sessions on AO-13. The frequency is 145.955 MHz. The net meets at 45 minutes before Mode S, and on Mode B following Mode S on Saturdays and Sundays. Join those sessions or convey your wishes for other SSTV skeds to wb6llo@amsat.org, and he will coordinate your efforts.

FO-20: The following is the current schedule for transponder operations:
ANALOG MODE:
20-Apr-94 7:35 -to- 27-Apr-94 7:55 UTC
11-May-94 6:54 -to- 18-May-94 7:20 UTC
Digital mode: Unless otherwise noted above.
[Kazu Sakamoto (JJ1WTK) qga02014@niftyserve.or.jp]

AO-27: DL6AAU reports that he has hear some "big" signals from AO-27 with a indoor groundplane antenna without preamp. He receives signals S56 to S59 from stations on Buffin Island, which for DL6AAU, is considered a DX contact. DL6AAU notes that AO-27 really better signal than its famous "cousin" AO-21. [DL6UAA]

AO-21: A new digital voice message started to transmit this week on AO-21 on the occasion of the AMSAT-OE meeting. The actual schedule is as follows:

RUDAK-II Schedule: (Downlink 145.987 MHz, Uplink 435.016 MHz)
min/10 Beacon Mode
0..6 FM Repeater
7 Digital Audio
8..9 AFSK TLM
The following is the message that is broadcasted on AO-21 during the packet

beacon downlink: "++ Hi, this is the RUDAK-II experiment on AMSAT OSCAR 21
++ On occasion of the first AMSAT-OE meeting we send greetings to HAM's &
all over the world. We wish you to have PEACEFUL contacts via amateur
radio!" Reports are welcome to:
HTL
Amateur Radio Group
Anichstr. 46
A-6020 Innsbruck
Austria

[LW2DTZ]

KO-23: Working well and has a new pair of images. [WH6I]

KO-25: Also working well. [WH6I]

IO-26: Working well on the secondary frequency as advertised. [WH6I]

AO-16: Working well. [WH6I]

LO-19: Also working well. [WH6I]

The AMSAT NEWS Service (ANS) is looking for volunteers to contribute weekly
OSCAR status reports. If you have a favorite OSCAR which you work on a
regular basis and would like to contribute to this bulletin, please send
your observations to WD0HHU at his CompuServe address of 70524,2272, on
INTERNET at wd0hhu@amsat.org, or to his local packet BBS in the Denver, CO
area, WD0HHU @ W0LJF.#NECO.CO.USA.NOAM. Also, if you find that the current
set of orbital elements are not generating the correct AOS/LOS times at
your QTH, PLEASE INCLUDE THAT INFORMATION AS WELL. The information you
provide will be of value to all OSCAR enthusiasts.

SB SAREX @ AMSAT $STS-59.010
SAREX Keps Update 4/11 at 8:00 UTC

Greenbelt, MD, 4/11/94 at 8:00 UTC

The official SAREX element set for this morning will be GSFC-005. This element sent was generated by Ron Parise, WA4SIR, of the Goddard Space Flight Center. Gil Carman, WA5NOM, reports that the predictions using GSFC-005 are closer to the real-time Orbiter state vector than GSFC-007 or JSC-009.

513. Eprom 27C512 with access time of 120 ns

Newsgroup: rec.radio.amateur.space
Date: 1994-04-11 13:32:59 UTC
From: seeler@UPEI.CA
Message-ID: <seeler.101.0@UPEI.CA>
Source record: 27717

I was wondering if anyone knew of a Canadian or US distributer or supplier
for the following two items which are being considered for the Trakbox
hardware upgrade:

1. 27C512 Eprom (Dip package) with 120 nanosecond access time.
2. Dallas Semiconductor microprocessor DS80C320

Any suggestions as to names or numbers would be greatly appreciated.

In article <Cnyq2s.80@ncifcrf.gov> Joe Mack, mack@ncifcrf.gov writes:
>Get the ARRL &/or RSGB antenna handbooks. THe calculations for a helix
are
>trivial. They are wideband and non-critical in dimensions, unlike a
yagi.
>

Yeah, that is a very nice feature of them. Mine kept falling over tripod
and all when I first put it up (hey, I'm an EE, not an ME :-) and all the
dings
and bends didn't seem to faze it.

As for the calculations - my suggestion would be to put the formulas into
a spreadsheet so you can diddle the values and see what you come up with.
That is what I did and it was very handy in finally converging on a
working
design.

> However people don;t build them at 2m very often - they are more
>often used at UHF . I don't really know why but here are some guesses
>
> A 2m helix is large and hard to support (rods out from the center
>pole to the helix are long).

That is one important reason - they get fairly unweildy. After my
success with my 420-450 helix, I looked into doing one for 2 but
gave it up because of the size.

I think the other big reason is it's not as efficient an antenna for
the boom length. My 14 turn helix is 10 foot long and has about 15
db of gain. You can get the same gain smaller and lighter in a yagi
arrangement - but they are much trickier to adjust and have much
smaller usable bandwidth.

>
> It isn't 50 ohms. Itsa bout 140ohms and there are tricks to make
>it 50ohms but these are narrow band (still wide band by ham band
standards)
>and a little tricky to get going.

Go with the radial feed method (instead of coming into the center to
feed, you
squish the last turn into half the space, fatten the conductor to about 5
times the regular size (I used copper flashing) and feed it off the
center where
the turn comes down to the ground plane. On mine it easily handles the

band from
420 to 450. I use the same antenna for Oscar, ATV, SSB and FM.

>
> Maybe you can make more money by selling a yagi than a helix.
>
> It would beinteresting to find out the real reason, but most people
>if they want a fair bit of gain at 2m and 432 and want circular
polarisation
>they use crossed beams 1/4lambda apart

I think that is mostly the size vs gain issues. Helix'es are simple,
cheap,
forgiving, fun and work well. But they aren't the smallest antenna on the
block.

>From what I understand, a normal 2m or 70cm beam antenna would work, but a
>circular polorization would be much better. I have no idea how one would
>build a circular polorized antenna.

Circular polarized crossed yagis are fairly simple to build. There are a couple of ways to get circular polarization with them. The way KLM does it is to space one of the antennas 1/4-wave further up the boom than the other and then combine the two antennas with a simple matching harness (two 1/4-wave 75 ohm cables to a Tee fitting). Or you can take the Cushcraft path and mount the two antennas' elements at the same points on the boom and combine them as above, but with an additional 1/4-wave length of 50 ohm cable in one leg to get the required 90 degree phase shift.

There are other forms of circularly polarized antennas. A couple are the helix (both axial and quadrafilar) and the Lindenblad. You can also use disc or loop yagis with crossed dipole driven elements. These are more common at S band.

A nice simple antenna for S band can be constructed of all thread rod for the boom, fender washers for parasitic elements, and a bunch of jam nuts to hold everything in place. The crossed dipole driven elements can be made from a piece of printed circuit board (duroid) with the driven elements and their phasing and matching harnesses etched onto the board and held in place with nylon jam nuts. The whole thing will fit in a piece of PVC or fiberglass tubing for weatherproofing, or you can just cover the driven elements and reflector with pipe and let the rest hang out in the breeze after a cold galvanize spray. (You could use circuit board for all the elements, but that much duroid board gets expensive.)

(You can use a short bolt, a drill, and a file to size the OD of the parasitic element washers. Just put the washer on the bolt with jam nuts, chuck it in the drill, and file to size.)

SB NEWS @ AMSAT $SPC0411
* SpaceNews 11-Apr-94 *

BID: $SPC0411

=========
SpaceNews
=========

MONDAY APRIL 11, 1994

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It is published every week and is made available for unlimited distribution.

* NEW AO-13 SCHEDULE *
======================
Magnetorquing from attitude 180/0 to 230/-5 commenced on Apr 04 [Fri] 1810 UTC, orbit 4446/224, and continued for 8 perigees. The new schedule commenced on orbit 4452 MA 145 Apr 07 [Thu] 1120 UTC.

*** AO-13 TRANSPONDER SCHEDULE *** 1994 Apr 07-Jul 11
Mode-B : MA 0 to MA 170 |
Mode-BS : MA 170 to MA 218 |
Mode-S : MA 218 to MA 220 |<- S beacon only
Mode-S : MA 220 to MA 230 |<- S transponder; B trsp. is OFF
Mode-BS : MA 230 to MA 250 | Alon/Alat 230/-5
Mode-B : MA 250 to MA 256 |
Omnis : MA 250 to MA 120 | Move to attitude 180/0, Jul 11

NEW ATTITUDE - Note: The mean attitude for the period 1994 Apr 07-Jul 11 will be ALON/ALAT 230/0. This is an Alon 10 degrees "better" than originally proposed. It is achieved at the expense of a 10 degree "worse" Sun angle, which will will now reach 40 degrees (77% illumination) May 30-Jul 11. During that period the Mode-B transponder *might* have to be OFF from MA 250-80 to conserve battery power.

Please don't rely on gossip and rumour! Continuous up to date information about AO-13 operations is always available on the beacons, 145.812 MHz or 2400.664 MHz in CW, RTTY and 400 bps PSK. These bulletins are also posted to Internet, ANS, Packet, PacSats etc, and many international newsletters. A 400 bps PSK decoder is available from G3RUH and several DSP products; display software P3C.EXE etc from many AMSAT groups.

The active command stations are listed below, and constructive feedback about operations is always welcome.

Peter DB2OS @ DB0FAU.#NDS.DEU.EU
James G3RUH @ GB7DDX.#22.GBR.EU
Graham VK5AGR @ VK5WI.#ADL.#SA.AUS.OC

The above may also be reached via Internet (callsign@amsat.org) and KO-23.
Please remember to state clearly a return address.

Notes prepared on behalf of, and in total cooperation with the above by:

James Miller G3RUH @ GB7DDX.#22.GBR.EU 1994 Apr 04 [Mon] 0600 UTC

* AMSAT NET VIA SATELLITE *
==========
Bruce Paige, KB5ZRV, is the AMSAT Area Coordinator in Houston, Texas. Bruce runs a local AMSAT net that meets on the 147.100 MHz repeater every Tuesday evening at 10:00 PM local Central Time. The net is rebroadcast over the Galaxy 3 satellite, Transponder 17 on a 5.8 MHz subcarrier.

This net is then received live and retransmitted by repeater operators in Toronto, Canada, Anchorage, Alaska (3 repeaters), New England States (6 repeaters), Ontario, CA, Lawton, OK, Indianapolis, IN, Fargo, ND. It has also been heard in Hawaii and other states.

The net has a telephone number for those that would like to ask questions of the net or check in. There are beginners segments that lasts 3-5 minutes, and explain how satellite novices can work various satellites, describes different types of station equipment necessary to work satellites, and other topics that beginners find useful in getting started in satellite operations. SAREX operating techniques have also been covered.

This net re-broadcast is free for the taking by those with TVRO ground stations. The people who run the net are having a great time and have found many people are listening in that do not have AMSAT nets in their local areas.

Any comments can be directed to Bruce via the Internet at kb5zrv@amsat.org.

* FO-20 SCHEDULE *
==========
The FO-20 command station announced that FO-20 will be placed in Mode JA (Analog transponder mode) during Field Day 1994 (25-Jun-94 18:00 UTC through 26-Jun-94 18:00 UTC).

The current operating schedule is as follows:

Analog mode:
06-Apr-94 06:45 -to- 13-Apr-94 07:10 UTC
20-Apr-94 07:35 -to- 27-Apr-94 07:55 UTC
11-May-94 06:54 -to- 18-May-94 07:20 UTC

Digital mode:
Unless otherwise noted above.

[Info via Kazu Sakamoto, JJ1WTK]

* FUJI AWARD INFORMATION *
==========

Kazu Sakamoto, JJ1WTK, reports that a "Fuji" award is available to users of the FO-20 satellite. Applicants should have confirmed CW or SSB contacts with 10 different amateur stations through the FO-20 Amateur Satellite. A fee of 8 IRCs or US $4 will be charged per award. An additional 2 IRCs will be charged for air mail delivery regardless of the number of the awards claimed. If QSL cards are submitted, sufficient funds for return postage will also be required.

Correspondence should be sent to:
Japan Amateur Radio League -- Award Desk
1-14-2 Sugamo, Toshima, Tokyo 170, Japan

* SpaceNews BBS UPDATE *
==========

The SpaceNews packet radio BBS sponsored by Mario, KD6ILO, reported in last week's issue of SpaceNews has changed frequency. It can now be found operating on 145.050 MHz. The latest issue of SpaceNews, as well as other AMSAT and satellite-related news and information can be found on this BBS. The BBS is also linked to the UoSAT-OSCAR-22 satellite through the N7RSN SatGate also located in Tacoma, WA.

* THANKS! *

521. Two-Line Orbital Element Set: Space Shuttle

Newsgroup: rec.radio.amateur.space
Date: 1994-04-11 23:36:12 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.766107372@afit.af.mil>
Source record: 27725

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

523. High Altitude Balloon Flight in Colorado

Newsgroup: rec.radio.amateur.space
Date: 1994-04-12 01:32:49 UTC
From: rickvg@cscns.com
Message-ID: <1fVgjSEHGA9X057yn@cscns.com>
Source record: 27727

FLIGHT PROFILE FOR EOSS 16

LAUNCH DATE : April 23,1994
LAUNCH SITE: Thunder Ridge Middle School
Picadilly and Smokey Hill Rd.
Aurora, Colorado, USA
LAUNCH SITE COORDINATES: 39.62305 deg North
104.73544 deg West
LAUNCH TIME : 9:00 a.m.
FLIGHT EXPERIMENT: Ozone detection at various levels of the atmosphere
EXPERIMENT CONDUCTED BY: Random High School, Longmont Colorado.
PROJECT INTEGRATOR: Andy Kellett/ N0SIS
SECONDARY EXPERIMENT: Testing of the APRS.
(Automatic Position Reporting System)

FREQUENCIES:

Shuttle I:
Telemetry 144.340 MHz
Beacon 147.555
ATV 426.250

HF Net:
7230khz Phone + or - QRM

Foxhunters:
CRA Repeaters 147.225 MHz

PURPOSE OF THE FLIGHT:
There are several experiments that are going to be run on the flight of
EOSS 16.

1. The primary experiment will be the detection of Ozone at various
altitudes above Colorado. This experiment will be conducted by Random
High School. The students are interested in the Ozone concentration and
may do a follow up flight to see if the levels have changed. They will be
graphing the results and presenting them to the school science fair.

2. The second experiment will be the use of APRS (Automatic Position Reporting
System). The controller will be sending down text strings that will
include latitude and longitude in them which should plot the position of
the payload on any APRS equipped packet station within the footprint of
the balloon as the payload travels the skies of Colorado. The typical
footprint extends to ALL neighboring states. So, if you are in southern
Wyoming, south western Nebraska, western Kansas, western Oklahoma,
northern Texas, parts of New Mexico and Arizona and Eastern Utah, look

into tracking the progress of EOSS-16 with APRS. Of interest, noting the difference between Loran-C, which is used on Shuttle I, and GPS, which is used on Shuttle II.

In the Denver Metro Area check on my BBS, N0VSA-1 and find out where to get the APRS program.

From the APRS documentation:

THE LATEST APRS is posted on 410-280-2503 BBS. After version 3.11 I will also always post a file similar to: 400to401.zip which will contain only the files that changed in the lastest release.

Anyone interested is welcome to come to the launch site and experince what a EOSS flight is like. We will have the ground station computer set up and also have TV monitors set up so you can see the flight from the perspective of the payload's onboard B&W tv camera. After the payload has been launched there will plenty of people around to answer any questions that you may have.

Hope to see you there!!

Green Card Lottery 1994 May Be The Last One!
THE DEADLINE HAS BEEN ANNOUNCED.

The Green Card Lottery is a completely legal program giving away a certain annual allotment of Green Cards to persons born in certain countries. The lottery program was scheduled to continue on a permanent basis. However, recently, Senator Alan J Simpson introduced a bill into the U. S. Congress which could end any future lotteries. THE 1994 LOTTERY IS SCHEDULED TO TAKE PLACE SOON, BUT IT MAY BE THE VERY LAST ONE.

PERSONS BORN IN MOST COUNTRIES QUALIFY, MANY FOR FIRST TIME.

The only countries NOT qualifying are: Mexico; India; P.R. China; Taiwan, Philippines, North Korea, Canada, United Kingdom (except Northern Ireland), Jamaica, Domican Republic, El Salvador and Vietnam.

Lottery registration will take place soon. 55,000 Green Cards will be given to those who register correctly. NO JOB IS REQUIRED.

THERE IS A STRICT JUNE DEADLINE. THE TIME TO START IS NOW!!

For FREE information via Email, send request to cslaw@indirect.com

SB SAREX @ AMSAT $STS-59.011
SAREX QSO Opportunities 4/12

Greenbelt, MD, 4/12/94 at 11:00 UTC

The Shuttle Amateur Radio Experiment (SAREX) school group contacts have been quite successful. At this point, all but one school is complete. The SAREX Working Group will have more details on the success of these schools in later bulletins.

These succesful contacts have opened two school backup passes which can now be used for general voice operations. The SAREX Working Group anticipates that the STS-59 crew will be on-the-air during Orbit 56, which covers the western United States, starting around 20:56 UTC on April 12. In addition, the Paltamo, Finland, backup pass will provide hams in the Northern European area the opportunity to work the shuttle. This opportunity is expected to start at 7:08 UTC on April 13 during orbit 63.

As a reminder, the following are the voice uplink and downlink frequencies for SAREX:

Voice Downlink: (Worldwide) 145.55 MHz
Voice Uplink: 144.91, 144.93, 144.95, 144.97, 144.99 MHz
Voice Uplink: (Europe only) 144.70, 144.75, 144.80 MHz

Also, the voice call signs are N5QWL and N5RAX

The SAREX Working Group wishes you the best of luck in your efforts to contact the astronauts on the space shuttle Endeavour.

Submitted by Frank H. Bauer, KA3HDO for the SAREX Working Group

Gary Coffman (gary@ke4zv.atl.ga.us) wrote:

: A nice simple antenna for S band can be constructed of all thread rod
: for the boom, fender washers for parasitic elements, and a bunch of jam
: nuts to hold everything in place. The crossed dipole driven elements can
: be made from a piece of printed circuit board (duroid) with the driven
: elements and their phasing and matching harnesses etched onto the board
: and held in place with nylon jam nuts. The whole thing will fit in a piece
: of PVC or fiberglass tubing for weatherproofing, or you can just cover the
: driven elements and reflector with pipe and let the rest hang out in the
: breeze after a cold galvanize spray. (You could use circuit board for
: all the elements, but that much duroid board gets expensive.)

: (You can use a short bolt, a drill, and a file to size the OD of the
: parasitic element washers. Just put the washer on the bolt with jam
: nuts, chuck it in the drill, and file to size.)

So how big does the boom have to be for it to work well on Oscar 13?
A 15 turn helix on a 20 inch boom seems to work just fine with a good
PHEMT preamplifier (0.33 dB system NF). On a 10 degree pass I heard
the beacon from ARRL HQ parking lot through the roof of W1AW quite well.
I read up in Kraus on the dimensions to use. The boom length includes
the rear mounting bracket. The receive converter is a little too
light to balance the antenna.

When receiving, you don't want your phasing networks to be too lossy,
raising your system noise figure. True, you could just use a big
dish, but I don't think I could carry stick a 4 ft. dish in my
carry-on luggage and get away with it :-). At least on Domestic
flights, they will always let you carry on on 22 x 14 x 9 inch
bag.

STS-59/SAREX Update

After the successful check pass on April 9, the SAREX Working Group has had several reports of packet radio operation and some general voice QSO operation during the Shuttle passes over the US. In addition, the St. Bernard High School in Playa Del Rey, CA had a very excellent school group pass on April 10 (Rev 19). Students asked the astronauts a total of seven questions.

The official SAREX element set for this morning, April 11, will be GSFC-005. This element sent was generated by Ron Parise, WA4SIR, of the Goddard Space Flight Center. Gil Carman, WA5NOM, reports that the predictions using GSFC-005 are closer to the real-time Orbiter state vector than GSFC-007 or JSC-009.

SB SAREX @ AMSAT $STS-59.012
STS-59 Eastern R/S Times 04/12

Below are the rise and set times for STS-59 for selected US cities
over the next three days. This data was generated to help hams without
orbit programs to participate in the SAREX activities. Please note that
the times shown are UTC and NOT LOCAL TIME. This listing includes only
those passes with an elevation greater than 5 degrees. For information
regarding SAREX frequencies and operations procedures, check your
local PBBS, or bulletins from W1AW, W5RRR, W6VIO or WA3NAN.

Symbol key: rise = time that shuttle appears above horizon
tca = time of closest approach to observer
set = time that shuttle disappears below horizon
el = maximium elevation above horizon
geo = geometry: A = Ascending orbit, moving south to north
D = Descending orbit, moving north to south
E = passes east of observer
W = passes west of observer

SAREX Keps 4/13 at 5:40 UTC

Greenbelt, MD, 4/13/94 at 5:40 UTC

The official SAREX element set at this time is GSFC-014. This element set was generated by Ron Parise, WA4SIR, of the Goddard Space Flight Center. Gil Carman, WA5NOM, reports that the predictions using GSFC-014 were 13 seconds earlier than GSFC-005 as of 18:00 UTC on 4/12.

The SAREX Working group has had several inquiries regarding the use of "older" element sets during the STS-59 mission. Daily trim burns are planned during this flight to keep the ascending node crossing to within 0.1 degree of the planned preflight Keps. Thus, for periods of time, some of the "older" keps are closer to the current orbiter state vector than the somewhat "newer" Keps. If you run a comparison of the various orbital elements produced thus far, they are all within 10 to 20 seconds of one another. Gil Carman reports that this same trim burn approach was used during the STS-9 mission which also carried Owen Garriott, W5LFL.

533. Working AO-21 with TH-78A

Newsgroup: rec.radio.amateur.space
Date: 1994-04-13 10:47:38 UTC
From: gosset@pbr322.ceingebi.unam.MX
Message-ID: <Pine.3.87.9404131038.C18692-0100000@pbr322>
Source record: 27740

Hello everyone,

I am interested in working AO-21 using the 435.015 uplink
frequency. However, I have a kenwood TH-78A and have not been able to
enter that frequency, the closest I can get is 435.0125. This is because
the freq. steps that can be selected on UHF are: 10, 12.5 20 or 25 kHz.
My questions are: can I work AO-21 on 435.0125?
How can I modify the TH-78A so it can transmit on 435.015?

Your answers to these questions and general comments about working
AO-21 will be greatly appreciated.
Hope to hear you on AO-21 soon!

534. Omni antennas for AO-16

Newsgroup: rec.radio.amateur.space
Date: 1994-04-13 12:56:46 UTC
From: n7ryw@teleport.com
Message-ID: <n7ryw.4.000CF29C@teleport.com>
Source record: 27742

This fall, I will be sailing my 30 Catalina to Hawaii. I have HF and Maririme mobile, but I would like to be able to use AO-16 as well. I have been on the pacsats for 3 years, but I have always used steered directional antennas (the long KLMs). Since these would be quite impractical on my boat, I want to see if an omnidirectional set of antennas can be effective on AO-16. I would rather do it on KO-23, but there just wouldn't be enough gain...

I have used a turnstile type of antenna on 137 mHz weather sats, but that is the end of my experience with omnis and sats. Does anyone use this or any other with good success? I can get the Eggbeater type antennas too, but nobody locally has used one on Pacsats....

Anyway, it would really be fun to keep up on the sats during my trip, as I plan on staying the Winter in Hawaii, and I don't want to go through satellite withdrawals!!!

Thanks, Bill, n7ryw@teleport.com Portland, OR

Nurad makes a commercial version of the antenna I described (for the
1.9 GHz band). They claim 19 dbc for it. It's about 4 feet long and 2
inches in diameter including the fiberglass housing and transmitter
mount. We use a tripod bag to hold it and a tripod. The stewardess
will stow it with carry on garment bags. We carry the transmitters
and receivers in a small Haliburton case that will stow in the overhead
compartments. We buy a ticket for our camcorders so they can ride up
front too. It doesn't pay to allow the baggage handlers to get their
hands on delicate electronics. The antenna is very rugged, however,
and can take a lot of abuse. The ones on our vehicles have survived
impacts with tree limbs at highway speed.

I don't know the gain of your helix, but I expect it's considerably
less than 19 dbc, so you should be able to use the rod and washer
antenna design for Oscar 13.

Gary

538. NACEC-ARS Net Info.

Newsgroup: rec.radio.amateur.space
Date: 1994-04-13 20:02:00 UTC
From: Nacec.Hq@datag.mmbbs.mn.org
Message-ID: <319_9404132004@mmbbs.mn.org>
Source record: 27741

All of you fellow hams seriously interested in helping handle emergency radio message traffic, have we got a challange for you. NACEC, The North American Center For Emergency Communications, is building a high speed traffic system called NACEC-ARS (Affiliate Radio System).

The purpose of this net is to handle emergency traffic throughout North America. The goal is to build a system to get traffic delivered in about 60 minutes or less from the time it is put on the network.

NACEC-ARS also helps provide initial communications support between NACEC's Emergency Communications Field Teams and NACEC's Main Communications Center, to be build on 216 acres in Western Minnesota.

Information & Training nets are held every Sunday and Thursday. All stations interested in getting more information on NACEC, NACEC-ARS or information on getting involved in helping others with your radio skills are invited to check in. If you wish information the NSC will take your name, calls and the type of information you have requested. Net information follows:

Sunday Information & Training Nets:
NACEC-ARS/A 19:00 UTC 3.860 Mhz LSB
NACEC-ARS/B 20:00 UTC 7.262 Mhz LSB
NACEC-ARS/C 21:00 UTC 14.347 Mhz USB

Thursday Information & Training Net:
NACEC-ARS/D 9 PM local MN time on the TCFMC repeater
146.76 (output)

** If you hear a net in progress designated as NACEC-ARS/E it is an Emergency Traffic Net that is handling real Emergency traffic. Please do not interupt or check into these nets unless requested by the NCS or you are an authorized NACEC-ARS member station.

Hope to see all of you serious traffic handlers and others wishing to help, from around the U.S. and Canada on the nets. We can use all the help and support we can find to handle traffic in emergency situations. A mountain is only one shovel of earth each for a million people. Get involved and prepaired to help move a mountain of messages for those in need.

Thanks
73
Ed Addy/KE0EG
President

In article <Xy6Jkc1w165w@barf80.nshore.org>, wb8k@barf80.nshore.org (Dennis jakubisin) says:
>
>Anyone know of an inexpensive (less that the $300+ commercial converters)
>way to get on Mode S. How about converting some of the TVRO LNA/B's down
>in freq??

TVRO LNA's are a bit unstable for narrow band signal work. The two most popular approaches to getting on Mode S are the SSB electronics 2.4 GHz down-converter or the Down East Microwave (DEM) down-converter. I operate on Mode S using the DEM setup. I use a three foot Ku dish (Wineguard) , a DEM low noise preamp and the DEM down-converter. The preamp is needed due to the length of coax between the dish feed and the weather proof housing I use for the down-converter. The SSB reportedly is weather-proof and can be mount at the feed point of the antenna. The cost of the DEM gear is ~$140 for the preamp and ~200 for the down-converter, if my memory serves me. The SSB system is about $400, as I remember. Down East Microwave advertises in QST as does the US rep for SSB Electronics.

Good luck!

19 dBc on a 7.7 wavelength boom is quite good. By contrast, a
26 element K1FO yagi has only 18.8 dBi of gain on 432 MHz.
Unfortunately, I've not been able to find anything in the
literature on designing such antennas. I'm pretty sure that
segment oriented programs are useless for designing them--far
too many segments to model even a couple of parasitically
coupled disks (how much can you do with a few hundred segments?).

I'd conservatively estimate the helix gain to be 15 dBic, enough for
a gain to temperature ratio greater than 1. A helix tends to be down
a dB or two in gain from an optimized yagi, but I'm not sure that the
savings in boom length is worth making all those elements! (cut the
boom length from 20 to 17 inches) Maybe if the uplink antenna were
comparable in size (at a modest power level)....

An interesting question that comes up is the relative temperatures
of the two arrays. This is important because of the low preamplifier
noise temperature. My guess is that a helix would tend to have a
lower noise temperature. This may be enough to offset the lower
gain. An interesting exercise is to graph the receiver sensitivity
vs. noise figure at various sky noise temperatures.

I have tried to "get" the file /pub/msdos/hamradio/v219331.zip a couple times
from the oak.oakland.edu site and several other mirror sites. It doesn't
appear to be there. I can "get" any other file at that site just fine but I get an
error message back when I try to "get" it that indicates that the file v219331.zip
is not a file. What gives? I have been trying to find this program a couple of times
and have been unsuccessful.Why don't people who have that program just use
it on the vectors that they seem to be able to get an just upload the keplarian
elements? Seems like the right thing to do to me.

549. Two-Line Orbital Element Set: Space Shuttle

Newsgroup: rec.radio.amateur.space
Date: 1994-04-14 22:57:47 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.766364267@afit.af.mil>
Source record: 27753

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

551. SAREX element set 4/14/94 at 0:40 UTC

Newsgroup: rec.radio.amateur.space
Date: 1994-04-15 02:27:20 UTC
From: marcbg@netcom.com
Message-ID: <$STS59017.1994@ampr.org>
Source record: 27756
Cross-posted to: rec.radio.amateur.misc,rec.radio.info,rec.radio.amateur.space

Greenbelt, MD, 4/14/94 at 0:40 UTC

The official SAREX element set at this time is GSFC-016. This element set
was generated by Ron Parise, WA4SIR, of the Goddard Space Flight Center.
Gil Carman, WA5NOM, reports that the predictions using GSFC-016 were 6
seconds earlier than GSFC-014 as of 15:00 UTC on 4/13.

STS-59
1 23042U 94020A 94103.28423883 0.00019321 11073-4 10308-4 0 169
2 23042 56.9943 245.4685 0009256 288.8199 71.1887 16.21374060 631

Satellite: STS-59
Catalog number: 23042
Epoch time: 94103.28423883 (13 APR 94 06:49:18.24 UTC)
Element set: GSFC-016
Inclination: 56.9943 deg
RA of node: 245.4685 deg Space Shuttle Flight STS-59
Eccentricity: 0.0009256 Keplerian Elements
Arg of perigee: 288.8199 deg
Mean anomaly: 71.1887 deg
Mean motion: 16.21374060 rev/day Semi-major Axis: 6593.9561 Km
Decay rate: 0.19E-03 rev/day*2 Apogee Alt: 221.67 Km
Epoch rev: 63 Perigee Alt: 209.46 Km

NOTE:
This element set is based on NORAD element set # 016.
The spacecraft has been propagated to the next ascending
node, and the orbit number has been adjusted to bring it
into agreement with the NASA numbering convention.

Submitted by Frank H. Bauer, KA3HDO for the SAREX Working Group

Changes: new mailing lists, .packet rmgroup, and .policy updates

(Note: The following is reprinted with the permission of the author.)

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info,
and rec.radio.swap newsgroups. It is intended to serve as a guide for the new
reader on what to find where. Questions and comments may be directed to the
author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@oac.hsc.uth.tmc.edu. This message was last changed on 18 September
1993 to add the mailing lists for the new rec.radio.amateur newsgroups, to
note the rmgroup of rec.radio.amateur.packet, and to officially retire some
(in)famous threads of discussion on rec.radio.amateur.policy.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

As the net grew, and as packet radio came into vogue, packet discussion began
to dominate other topics in the group and on the list. This resulted in the
logical solution: a group was created to hold the packet discussion, and
another corresponding mailing list was created as well: net.ham-radio.packet
and PACKET-RADIO, respectively.

These two groups served for several years, and went through Usenet's Great
Renaming essentially unchanged, moving from net.ham-radio[.packet] to
rec.ham-radio[.packet]. Readership and volume grew with the rest of the
network.

The INFO-HAMS mailing list was originally run from a US Army computer at
White Sands Missile Range, SIMTEL20. There were few problems with this
arrangement, but one was that the system was not supposed to be used for
commercial purposes. Since one of hams' favorite pastimes is swapping
gear, it was natural for hams to post messages about equipment for sale
to INFO-HAMS/rec.ham-radio. This ran afoul of SIMTEL20's no-commercial-use
restriction, and after some argument, a group was created specifically
```

for messages like that: rec.ham-radio.swap. This group wasn't gatewayed to a mailing list, thus avoiding problems.

While all this was happening, other folks wanted to discuss other aspects of the world of radio than the personal communications services. Those folks created the rec.radio.shortwave and rec.radio.noncomm newsgroups, and established the precedent of the rec.radio.* hierarchy, which in turn reflected Usenet's overall trend toward a hierarchical name structure.

The debate between proponents of a no-code ham radio license and its opponents grew fierce and voluminous in late 1989 and 1990. Eventually, both sides grew weary of the debate, and those who had not been involved even more so. A proposal for a newsgroup dedicated to licensing issues failed. A later proposal was made for a group that would cover the many recurring legal issues discussions. During discussion of the latter proposal, it became clear that it would be desirable to fit the ham radio groups under the rec.radio.* hierarchy. A full-blown reorganization was passed by Usenet voters in January 1991, leading to the overall structure we now use.

After the reorganization, more and more regular information postings began to appear, and were spread out across the various groups in rec.radio.*. Taking the successful example of the news.answers group, where informational postings from across the net are sent, the group rec.radio.info was created in December, 1992, with Mark Salyzyn, VE6MGS, initially serving as moderator.

In January, 1993, many users started complaining about the volume in rec.radio.amateur.misc. This led to a discussion about a second reorganization, which sparked the creation of a mailing list by Ian Kluft, KD6EUI. This list, which was eventually joined by many of the most prolific posters to the ham radio groups, came up with a proposal to add 11 groups to the rec.radio.amateur hierarchy in April 1993. The subsequent vote, held in May and early June, approved the creation of five groups: rec.radio.amateur.digital.misc (to replace .packet), .equipment, .homebrew, .antenna, and .space.

The Current Groups

I can hear you asking, "OK, so this is all neat history, but what does it have to do with me now?" The answer is that the history of each group has a direct bearing on what the group is used for, and what's considered appropriate where.

The easy one is rec.radio.amateur.misc. It is what rec.ham-radio was renamed to during the reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize

this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, should be removed by September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is now rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there.

The first reorganization added two groups to the list, one of which is rec.radio.amateur.policy. This group was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The other added group is rec.radio.cb. This is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently Mark Salyzyn, VE6MGS. The email address for submissions to the group is rec-radio-info@ve6mgs.ampr.ab.ca. Inquires and other administrivia should be directed to rec-radio-request@ve6mgs.ampr.ab.ca. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas,

commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

A Few Words on Crossposting
===========================

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

SB SAREX @ AMSAT $STS-59.019
STS-59 Eastern R/S Times 04/15

Below are the rise and set times for STS-59 for selected US cities
over the next four days. This data was generated to help hams without
orbit programs to participate in the SAREX activities. Please note that
the times shown are UTC and NOT LOCAL TIME. This listing includes only
those passes with an elevation greater than 5 degrees. For information
regarding SAREX frequencies and operations procedures, check your
local PBBS, or bulletins from W1AW, W5RRR, W6VIO or WA3NAN.

Symbol key: rise = time that shuttle appears above horizon
tca = time of closest approach to observer
set = time that shuttle disappears below horizon
el = maximium elevation above horizon
geo = geometry: A = Ascending orbit, moving south to north
D = Descending orbit, moving north to south
E = passes east of observer
W = passes west of observer

* Deorbit burn is scheduled to occur on orbit 165, with a landing at KSC
on orbit 166 at 15:53 UTC April 19. Data for subsequent orbits is provided
in the event of a landing delay.

SB SAREX @ AMSAT $STS-59.021
STS-59 Western R/S Times 04/15

Below are the rise and set times for STS-59 for selected US cities
over the next four days. This data was generated to help hams without
orbit programs to participate in the SAREX activities. Please note that
the times shown are UTC and NOT LOCAL TIME. This listing includes only
those passes with an elevation greater than 5 degrees. For information
regarding SAREX frequencies and operations procedures, check your
local PBBS, or bulletins from W1AW, W5RRR, W6VIO or WA3NAN.

Symbol key: rise = time that shuttle appears above horizon
tca = time of closest approach to observer
set = time that shuttle disappears below horizon
el = maximium elevation above horizon
geo = geometry: A = Ascending orbit, moving south to north
D = Descending orbit, moving north to south
E = passes east of observer
W = passes west of observer

* Deorbit burn is scheduled to occur on orbit 165, with a landing at KSC
on orbit 166 at 15:53 UTC April 19. Data for subsequent orbits is provided
in the event of a landing delay.

562. Two-Line Orbital Element Set: Space Shuttle

Newsgroup: rec.radio.amateur.space
Date: 1994-04-16 01:04:11 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.766458251@afit.af.mil>
Source record: 27865

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

564. Two-Line Orbital Element Sets (TLE377)

Newsgroup: rec.radio.amateur.space
Date: 1994-04-16 01:07:00 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.766458420@afit.af.mil>
Source record: 27867

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

566. OSCAR 21 UPLINK FREQ

Newsgroup: rec.radio.amateur.space
Date: 1994-04-16 11:59:18 UTC
From: dt650@cleveland.Freenet.Edu
Message-ID: <2oojum$di2@usenet.INS.CWRU.Edu>
Source record: 27869

The OSCAR 21 uplink frequency is 435.016 MHz. .015 works fine.
20 watts into a six element beam will do the trick when the
big guns aren't walking all over everybody.

Downlink is 145.987, of course.

SB SAREX @ AMSAT $STS-59.023
STS-59 Extension Day

Greenbelt, MD, 4/17/94 at 15:40 UTC

The STS-59 mission has been extended by one day. Landing is now set for
15:53 UTC on Tuesday April 19. This extension day provides an additional
day of SAREX operations for those interested in making a SAREX contact.

The official SAREX element set for today is still JSC-021. This element
set was generated by Gil Carman, WA5NOM, of the Johnson Space Flight Center.

570. AMSAT via email??

Newsgroup: rec.radio.amateur.space
Date: 1994-04-17 16:15:18 UTC
From: brent@network.ucsd.edu
Message-ID: <2ornam$1v4@network.ucsd.edu>
Source record: 27874

Could someone tell me if AMSAT/NA is reachable via email, and if so, what is their address? I am unable to contact them via regular post as I am at the South Pole in Antarctica, and will not have access to regular mail until November.

In particular, I am trying to acquire a copy of the satellite tracking program "InstantTrack" which I understand is distributed by AMSAT/NA.

Please email if possible, as it is not always easy to access the newsgroups over the satellite systems.

Thanks for any help,

Brent Jones, KB1UK/KC4AAA
South Pole Communications
brent@fred.spole.gov

SB SAT @ AMSAT $ANS-106.01
GARC LANDLINE BBS OPENS

HR AMSAT NEWS SERVICE BULLETIN 106.01 FROM AMSAT HQ
SILVER SPRING, MD APRIL 16, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-106.01

Goddard Amateur Radio Club (GARC) Landline BBS Operations Begin

The NASA Goddard Amateur Radio Club (GARC), Inc. in Greenbelt, MD has been working behind the scenes on projects that may benefit all amateur radio operators in general and perhaps AMSAT members in particular.

Ron Parise (WA4SIR) has been "beta" testing a Bulletin Board System (BBS) which is accessible via the INTERNET through telnet and ftp (file transfer protocol), a telephone modem, and packet radio (locally on 145.090 MHz and non-locally through "packet wormholes"). With Ron's heavy STS-67 crew training as of late, Jim Blackwell (N3KWU) is picking up much of the work to complete the "beta" testing phase. The BBS contains keplerian orbital elements updated daily, AMSAT bulletins, SAREX bulletins, club member mail service, club announcements, space shuttle mission infor-mation and lots more.

Access via Internet: wa3nan.gsfc.nasa.gov or 128.183.105.17
via landline: 301-286-4137
via packet: WA3NAN on 145.090 MHz in Washington, DC area

Additionally, the Goddard Amateur Radio Club has a home page for public viewing on the GARC World Wide Web server. It contains the latest GARC Newsletter in electronic form, latest space shuttle keps, GARC calendar of events, details of upcoming club activities, current WA3NAN QSL card, club facility-repeater-BBS info, a morse code experiment and more.

WWW access URL:
http://macgwy-mac2.gsfc.nasa.gov/garc/wa3nan-home-page.html

The GARC Web server was developed and is maintained by club president Jim Blackwell (N3KWU) (n3kwu@amsat.org). All radio amateurs are invited to check out its potential. This medium is the hottest item on the INTERNET today.

[The AMSAT News Service (ANS) would like to thank WD8LAQ for this bulletin item. WD8LAG can be reached at his INTERNET address of wd8laq@amsat.org.]

AMSAT PBBS CHANGES FREQUENCY

HR AMSAT NEWS SERVICE BULLETIN 106.02 FROM AMSAT HQ
SILVER SPRING, MD APRIL 16, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-106.02

AMSAT PBBS Changing Frequency 15-APR-1994

The AMSAT PBBS will be changing frequency and modes starting 15-APR-1994 at 16:00 UTC. The AMSAT PBBS will be on a "Mark" freqeuncy of 14.079 MHz, that is 14.181.1 MHz AFSK LSB using the mode Pactor with the callsign WT0N. The new schedule will be as follows: Monday through Saturday from 16:00 UTC until 23:00 UTC on a "Mark" frequency of 14.079 MHz. From 23:30 UTC until 04:00 UTC on a "Mark" freqeuncy of 7.073.5 MHz, that is 7.075.6 MHz AFSK LSB, using the Mode Pactor. These changes have been made to better serve AMSAT users with improved coverage and the use of a mode that many of the users have expressed an interest in. If anyone would like to use the Mode G-TOR, please let W0TN and he will see about setting up a schedule for G-TOR users. Please send any comments or suggestions to one of the following addresses:
INTERNET: BJARTS@STTHOMAS.EDU
PACKET: WT0N@WB0GDB.#STP.MN.USA.NOAM
PACTOR: WT0N

The AMSAT PBBS will have updated Keps and AMSAT BULLETINS, along with SpaceNews and other satellite related items.

[The AMSAT News Service would like to thank B.J. Arts (WT0N) for this bulletin item.]

SB SAT @ AMSAT $ANS-106.03
AO-13 OPS NET SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 106.03 FROM AMSAT HQ
SILVER SPRING, MD APRIL 16, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-106.03

Current AMSAT Operations Net Schedule For AO-13

AMSAT Operations Nets are planned for the following times. Mode-B Nets are conducted on AO-13 on a downlink frequency of 145.950 MHz. If, at the start of the OPS Net, the frequency of 145.950 MHz is being used for a QSO, OPS Net enthusiasts are asked to move to the alternate frequency of 145.955 MHz.

Date UTC Mode Phs NCS Alt NCS
18-Apr-94 0100 B 188 W5IU WA5ZIB
23-Apr-94 1800 B 180 VE2LVC W9ODI
30-Apr-94 2130 B 176 W9ODI VE2LVC

09-May-94 0000 B 175 W5IU WA5ZIB
14-May-94 1700 B 167 WA5ZIB W5IU
21-May-94 2130 B 185 VE2LVC W9ODI

Any stations with information on current events would be most welcomed. Also, those interested in discussing technical issues or who have questions about any particular aspect of OSCAR statellite operations, are encouraged to join the OPS Nets. If neither of the Net Control Stations show up, any participant is invited to act as the NCS.

Slow Scanners are invited to join the SSTV sessions on AO-13. The frequency is 145.955 MHz. The net meets at 45 minutes before Mode S, and on Mode B following Mode S on Saturdays and Sundays. Join those sessions or convey your wishes for other SSTV skeds to wb6llo@amsat.org, and he will coordinate your efforts.

Mode-S : MA 220 to MA 230 |<- S transponder; B trsp. is OFF
Mode-BS : MA 230 to MA 250 | Blon/Blat 230/-5
Mode-B : MA 250 to MA 256 |
Omnis : MA 250 to MA 120 | Move to attitude 180/0, Jul 11
[G3RUH/DB2OS/VK5AGR]

FO-20: The following is the current schedule for transponder operations:
ANALOG MODE:
20-Apr-94 7:35 -to- 27-Apr-94 7:55 UTC
11-May-94 6:54 -to- 18-May-94 7:20 UTC
Digital mode: Unless otherwise noted above.
[Kazu Sakamoto (JJ1WTK) qga02014@niftyserve.or.jp]

STS-59: To obtain a QSL, either as a result of a SWL or for a QSL, send your report or QSL to ARRL EAD, STS-59 QSL, 225 Main Street, Newington, CT 06111, USA. Include the following information in your QSL or report: STS-59, date, time in UTC, frequency and mode (FM voice or packet). In addit-ion, you must also include an SASE (or sufficient IRCs) using a large, business-sized envelope if you wish to receive a card. The Orange Park Amateur Radio Club in Florida has generously volunteered to manage the cards for this mission. [Bob Inderbitzen (NQ1R) Assistant to the Manager,

ARRL Educational Activities]

KO-23: Working well and has a new pair of images. [WH6I]

KO-25: Working well. A number of new images can be found on KO-25 but since the wide angle images are in a new format that so far has not been decoded, and since narrow angle images are very hard to locate in the absence of the companion wide angle image there is very little to get out of the images that are available. [WH6I]

AO-16: Working well. WH6I notes that usage on the 1200 baud OSCARS has has dropped off considerably. [WH6I]

LO-19: Working well. [WH6I]

The AMSAT NEWS Service (ANS) is looking for volunteers to contribute weekly OSCAR status reports. If you have a favorite OSCAR which you work on a regular basis and would like to contribute to this bulletin, please send your observations to WD0HHU at his CompuServe address of 70524,2272, on INTERNET at wd0hhu@amsat.org, or to his local packet BBS in the Denver, CO area, WD0HHU @ W0LJF.#NECO.CO.USA.NOAM. Also, if you find that the current set of orbital elements are not generating the correct AOS/LOS times at your QTH, PLEASE INCLUDE THAT INFORMATION AS WELL. The information you provide will be of value to all OSCAR enthusiasts.

Greenbelt, MD, 4/17/94 at 15:40 UTC

The STS-59 mission has been extended by one day. Landing is now set for
15:53 UTC on Tuesday April 19. This extension day provides an additional
day of SAREX operations for those interested in making a SAREX contact.

The official SAREX element set for today is still JSC-021. This element
set was generated by Gil Carman, WA5NOM, of the Johnson Space Flight Center.

I've always seen phased antenna arrays used for more precise pointing, not
for increased gain. Of course, with a narrower "beam" you GET more gain,
so maybe it isn't as unusual an idea as it first seemed....

COmbinng antennas into arrays is covered in most texts on antennas. You
will have to do it at receive frequency and feed the power to a combiner. The
pointing accuracy needed will be approx that for an antenna with the diam=
spacing between the two dishes (ie you'll need to be very accurate), while
the signal will only go up 3bd. This is great for radia astronomy where you
want to know exactly where your source is. However you just want more
signal, in which case it will be easier to buy a bigger dish.

published every week and is made available for unlimited distribution.

* STS-59 SAREX NEWS *
====================
The following are some packet frames received from the Space Shuttle
Endeavour by Andy, WA5ZIB:

W5RRR-1>SAREX [04/12/94 10:13:38] :
This is STS-59 SAREX Robot station W5RRR-1
onboard the Space Shuttle Endeavour.

W5RRR-1>QST [04/12/94 10:14:01] :
Thanks to all of you hams who have connected to our packet station
and worked us on voice! It really makes us feel closely connected
to the people and places that we are flying over. On board Endeavour
things are working very well - the scientists are very happy with the
data they are acquiring. I am very happy to be back in space, and it
all feels very familiar and nice. Our crew has been very well trained,
and we were able to accomplish all our tasks as scheduled so far.
We have had some spectacular views of Earth - we just flew over Tahiti,
for example.

73, N5QWL
12 April 1994 02:20 UTC

QSLs are available through the ARRL at the following address:

ARRL
ATTN: STS-59 QSLs
225 Main Street
Newington, CT 06111
USA
```

Include a self-addressed stamped envelope (SASE) with your QSL. Non-US stations should include a self addressed envelope with $0.50 of US postage affixed or appropriate IRCs. Include the callsign worked, date, UTC, mode, and frequency. For packet contacts, include the QSO number issued by the Robot. SWL QSLs: Include the callsign heard, date, UTC, mode, and frequency.

* SOLAR ECLIPSE INFORMATION *
==========
On 1994 May 10 (Tue), an annular solar eclipse will be visible throughout North and Central America. The May issue of "Sky & Telescope" (p 72ff) details this event, the last of its type visible in the continental US until 2012 May 20.

Scott, KF9QK, plans to monitor 10-meter beacons for the effect of the eclipse on radio propagation. Of interest is a predicted 'bow shock' effect on ionospheric propagation as the annular eclipse proceeds, so amateurs should plan observations well ahead and after their astronomical eyeball brethren. Observations of any effect on V/UHF propagation are also of interest. A log of conditions before, during and after the event would be most helpful. "Sky & Telescope" provides the needed planning information. Radio observers, of course, need not worry about atmospheric conditions.

Weather-wise, observers can also expect noticeable shifts in temperature, pressure and wind during the annular eclipse. An observer in Indiana has requested such information, which, if forwarded to KF9QK, will be relayed. Again, the better the log, the more it's worth.

Scott may be reached via packet radio at: KF9QK @ N9HSI.IL.USA.NOAM

[Info via KF9QK]

* AMSAT PBBS MOVE *
==========
The AMSAT PBBS changed frequency and modes on April 15th at 1600 UTC. The AMSAT PBBS will be on a Mark frequency of 14.079 MHz, (that's 14.1811 MHz AFSK LSB), using Pactor with the callsign WT0N. The new schedule will be as follows: Monday through Saturday from 1600 UTC until 2300 UTC on a Mark freqeuncy of 14.079 MHz. From 2330 UTC until 0400 UTC on a Mark freqeuncy of 7.0735 MHz (that's 7.0756 MHz AFSK LSB), using Pactor. These changes have been made to better serve AMSAT users with greater coverage and use of a mode that many of the users have expressed an interest in. If anyone would like to use the Mode G-TOR, please let WT0N know and he will see about setting up a schedule for G-TOR users. Please send any comments or suggestions to one of the following:

INTERNET: BJARTS@STTHOMAS.EDU
PACKET: WT0N@WB0GDB.#STP.MN.USA.NOAM
PACTOR: WT0N

The AMSAT PBBS will have updated Keps and AMSAT bulletins, along with SpaceNews and other satellite related items.

[Info via BJ Arts, WT0N]

* JOHNSON SPACE CENTER BBS INFORMATION *
==
The Johnson Space Center Amateur Radio Club has set up a telephone computer bulletin board (BBS). The purpose of the BBS is to provide a source of current Space Shuttle mission Keplerian Elements.

There are limited number of BBS files available for downloading.
Among the current files are:
o Current and old element sets for the mission in progress
o Current mission information
o Shuttle Amateur Radio Experiment (SAREX) information
o Recent Space Shuttle Mission Schedules and Manifests
o Astronaut/Cosmonaut Ham List
o Current JSC Amateur Radio Club Newsletter

We ask that no files be uploaded to the BBS.

The telephone number is (713) 244-5625. The speed is anything up to 9600 baud. The parameters are N-8-1.

The BBS is currently running in ProComm HOST mode, so the log on is very simple and downloading is easy.

After logging in you will see the Welcome Screen describing the BBS. Also, the Welcome Screen contains the current and latest element set number (e.g., JSC008) loaded on the BBS. Check it against your last set so you won't waste your time duplicating a set you already have.

Press ENTER to bring up the second page containing the current Space Shuttle Keplerian Element Set. If you have a file capture or screen capture function in your communications software, use it for this page. That way, you won't have to go through the file download process if all you wanted was the latest element set.

If you have any comments for the Club or BBS sysop, leave a message and the sysops will respond.

Dale Martin, KG5U @ KA5KTH.#SETX.TX.USA.NA
Secretary, Johnson Space Center ARC
Houston, Texas

* AMATEUR SPACE SHOT *
======================
With funding from the National Space Society, the Pacific Rocket Society (PRS) is building a nitric acid/furfuryl alcohol rocket designed to achieve an altitude of 80 kilometers--the edge of space.

Of interest to the AMSAT folks is the television and data telemetry payload designed and built by Duncan Cumming, KD6GKE. (Duncan is a native of Birmingham England and holds a PhD in Electrical Engineering from Cambridge University.) The system transmits video from a small security camera at 434 MHz and data at 145.75 MHz.

The data channels include GPS, magnetometer, accelerometer, altimeter, launch detector, engine temperatures and pressures and status switches. The heart of the system is a Tattletale IV single board 6303 based computer.

An article on Duncan's telemetry system, co-authored by George Morgan, WB6ZUV, appears in the April 1994 issue of "High Power Rocketry."

The launch will be from the Pacific Rocket Society test site in the Mojave Desert later this year.

The PRS meets monthly in the physics classroom of Chaminade College Preparatory, West Hills, California. Inquiries about the project can be sent to PRS president Charles Pooley, KD6HKU at ckp@netcom.com or to Dave Reeves at kf6pj@amsat.org or chaminade@amsat.org.

[Info via Dave Reeves, KF6PJ/WA6BYE]

* FO-20 SCHEDULE *
==========
The FO-20 command station announced that FO-20 will be placed in Mode JA (Analog transponder mode) during Field Day 1994 (25-Jun-94 18:00 UTC through 26-Jun-94 18:00 UTC).

The current operating schedule is as follows:

Analog mode:
20-Apr-94 07:35 -to- 27-Apr-94 07:55 UTC
11-May-94 06:54 -to- 18-May-94 07:20 UTC

Digital mode:
Unless otherwise noted above.

[Info via Kazu Sakamoto, JJ1WTK]

* THANKS! *

You are both in the right place. The orbital data appears here regularly,
and
is usually titled $ORBnnn.type, where the "nnn" is a sequentially assigned
number and the "type" may be weather (WX), amateur (OSCAR) or other fairly
easily decoded suffix. You may also see the title containing the word
"KEPS,"
short for Keplerian orbital data.

Recently several folks have been posting their own original works or
duplicates of the ARRL and AMSAT listings into the rec.radio.amateur.misc
newsgroup, which is strongly discouraged. Keep looking here, you'll find
much valuable news here, including SpaceNews, the AMSAT bulletins, and
other
helpful info.

Message-ID: <9404181849594.serapions.DLITE@delphi.com>
Source record: 27888

Hello,
My name is Paul and recently I have been reading a great book about satellites. The following is information that was covered in the first chapters.

A magnetic torquer is basically a rod with a coil wrapped around it. The direction of current into the coil can be changed. Torquers are used to counteract the earths magnetic field, as well as residual forces of the spacecraft. A magnetic dipole moment is produced when the coil is energized, defined as:
dipole moment = pole strength X distance between poles

A nutation damper is a tube partially filled with mercury and mounted on the spacecraft deck. It is a viscous damper, which damps out "nutation", (a "wobbly axis").

During the Hubble telescope repair, we heard a lot about Magnetometers. These are devices which measure the strength of a magnetic field, and also its direction. In its simplist form it is a solenoid coil with a ferromagnetic core. As it passes through the earths magnetic field a proportional output curreroduced.

Tracking refers to following, and plotting the path of an object. Telemetry, refers to the process of obtaining samples of data from various sensors and then transmitting the data to an earth station. The data from the sensors is first encoded and then modulated onto an RF carrier. The modulated carrier is transmitted to earth. A sensor measures some parameter such as radiation, temperature, pressure, or speed (RPM), and changes it into an electrical signal, which can be processed by a computer. Time division multiplexing or frequency division multiplexing are used to place all of the "telemetry data" on a single carrier.
Does anyone know the bandwidth requirement for telemetry (esp. PCM)?
Please leave a reply or contact "Paul" via Internet, my address is:
Serapions@delphi.com

585. Point me to the FAQ please...

Can someone point me to the FAQ for amateur satellites? I don't
seem to see it here or in rec.radio.info. I figure it is the best
place to start.
Also, if anyone knows of other net or hard copy resources that
could get
someone interested in getting into low power/low expense casual
satellite activity (who is currently fairly clueless about it all), I
would be very interested.
Thanks in advance...

combining will gain you +3B in ideal condx. This can be easily done on vhf.
On 1296 (a ham band) and above combiner losses are a pain. at C band (4GHz)
a wavelength gets pretty tiny, and the combiners must be very accurate
in mechanical dims. It's easy to get 1dB of mismatch loss.

Bottom line is, the answer is no for most of us. Better to extend the dish
with some "pedals" or to examine if you have ground noise getting in.

phased array antennas are commonly used to acheive gain.

>

You don't have to point the individual antennas in an array any better than
you would have to point them by them selves. You do have to match the line
lengths from the antennas to the power combiner at the higher pointing
accuracy, but this is relatively easy. In fact with a variable line length
you can steer the combined beam anywhere within the main beam of the
single dish.

You don't have to combine the signals at the carrier frequency either, if
the two downconverters are driven by the same local oscilator.
A high frequency power combiner might be cheap than two down converters.

Whether a big dish is easier than a few small dishes, depends on whether
you are more adept at mechanics or electronics, and how often you need
to reposition your dish.

?
NO, actually it should read 14.081.1 (minor typing error), and if you are
running a Kenwood you will want to center-tune at 14.081.2 instead. This
will put mark at the requested frequency with space 200 hz down from there.

If you have trouble copying, remember to also check your TNC's TxRev and
RxRev settings when running inverted like this.

591. Meteor scatter software V4.2 de OH5IY

Newsgroup: rec.radio.amateur.space
Date: 1994-04-19 16:30:32 UTC
From: jsi@vipunen.hut.fi
Message-ID: <2p10v8$fpu@nntp.hut.fi>
Source record: 27895

Good news for meteor scatter freaks !

Version 4.2 of OH5IY's meteor scatter software has been released today.
I have uploaded it into ftp.funet.fi: pub/ham/vhf-work/mssoft42.zip.

V4.2 has lots of improvements and changes compared to V4.1. The most
exciting new feature is true, measured activity of major showers. The
graphs show the profile of each shower 96 hrs around the peak. This is
something you really want to lay your hands on !!

Other new features or changes include:

- bar graphics ZHR history for major showers since 1980.
- updated shower data and improved peak calculation algorithms.
- meteor speed correction factor used in computing ant. elevation.
- sidescatter optimum elevations computed.
- day scanning on gradient curves with EGA&VGA.
- single screen shows all numeric gradient data.
- improved text editor and find function in sked-editor.
- improved install and default parameter setting program.
- better error handling.
- mouse control.
- creates \ms and \msdata subdirectories
- installs on any existing subdirectory.
- report can be sent 2 or 3 times on CW.

There are many new features not listed above. See readme42.com to find
them all.

If you are using this software, send a message to OH5IY for his records.
If you send your packet or e-mail address, you will get the new data files
automatically after each shower. OH5IY's e-mail and packet addresses are
mentioned in the end of readme42.com.

If you can't ftp but want a copy of the new version, send a formatted 3.5"
HD disk with 4 IRCs (or equal amount of USD) inside Europe, 6 IRCs outside
Europe, + Self Addressed Envelope (SAE) to Ilkka Yrjola OH5IY, Jukolan tie 16,
FIN-45740 Kuusankoski, Finland.

The first copies of the new version will be mailed out this week.

The latest version is always available by anonymous ftp at ftp.funet.fi
(128.214.6.100): pub/ham/vhf-work/mssof*.zip. The new versions will named
as mssof421.zip, mssof422.zip, mssoft43.zip etc. (Hint: use pkunzip -d to
open the .zip file). In future look also for msdata94.zip, which will
contain all new data files. It will be updated after each shower.

I have just found out that the IP-address of ftp.funet.fi has changed to
128.214.248.6 . I am not sure when this has happened, but for me the old one
seems to work aswell as the new ... A report from UK tells that the old
address is not valid any more. Fortunately, the name ftp.funet.fi works
in most cases. But if it doesn't, try the new IP-address.

Source record: 27901

I am interested into working the PacSats. Will it require me to have to buy two data radios or would one radio with 440receive and full duplex operation work? Particularly looking at the new IC-281H(I believe still pending FCC approval). Any help would be appreciated.

N6KOI - Pat

I agree that single-maintainer distribution for FAQ's and bulletins is
desirable under most circumstances. The down side is that a single
maintainer is also a single point-of-failure. A very powerful technique
for allowing multiple posters without duplication at any site is
available within Usenet news (essentially a hack of the Message-ID,
similar to the BID system on amateur packet radio). Currently the
rec.radio.info moderator coordinates several posters of ARRL bulletins,
mapping the packet bids to Usenet Message ID's. For example, ARRL Space
Bulletin 20 with a packet BID of $ARLS020 would map to:

Message-ID: <$arls020.1994@ampr.org>

Technically, Message ID's should contain the domain of the originating station, but since users from several domains may post the bulletins, and ultimately the bulletins may be considered to originate from amateur packet radio, making ampr.org the domain resolves the issue without subverting the intent of RFC 1036 too much (the addition of the year to the BID makes it unique indefinitely, which RFC 1036 strongly recommends).

Since the orbital elements have their own BID convention (starting with $ORB), such a multiple-poster arrangement can be used for them as well. If anyone is interested in becoming a volunteer "bulletin station" for Usenet for any bulletins with BIDS, contact the rec.radio.info moderator at rec-radio-request@ve6mgs.ampr.ab.ca. In this way, we can keep the information flowing fast and regularly without burdening any one person or small group of people too much while avoiding unnecessary duplication.

Are there any programs that use the OSVs for the mac to trak the shuttle?
Will these work with Orbitrack?
Also, where can a mac program be found to plot the track against the star background?

Any info appreciated

600. QRP satellite work

Newsgroup: rec.radio.amateur.space
Date: 1994-04-20 21:41:09 UTC
From: Kenneth.E.Harker@Dartmouth.Edu
Message-ID: <2p47hl$1q1@dartvax.dartmouth.edu>
Source record: 27904

I've been thinking of getting into amateur satellite work lately.
Just sort of rummaging through my AES catalog as a general benchmark
for prices, I've decided that the "top-end" satellite station, from
what I've read would be something like a Yaesu FT-736R transceiver, a
Yaesu G-5400B alt/az rotor w/ computer interface, a pair of KLM
circularly polarized yagis, a fiberglass boom, some sort of mount, an
amp/preamp, 15 to 30m of Belden 9913 and 8448 cable, a PC to run the
rotor controller software and tracking software, etc... around $5000US
or thereabouts.
Which is about $5000 more than what I have to spend right now :-)
My current setup is used mostly for packet and consists of a macintosh
computer, an unmodified Alinco DJ-580T, a KPC-3 TNC, an Astron RS-20A,
and a Hustler dualband base station vertical at about 15m above ground.
My question is what sort of satellite work can I do with this setup?
Anything? What sort of supplements could I add to it to work sats?
From what I have read so far, almost all of the satellites seem to
use SSB/CW. Can anything be done with FM? How does packet work? In
general, can anything be worked with a vertical ground plane antenna,
or do you have to use yagis with alt/az rotation? Is anything workable
on 5W, or would I really need an amp/preamp?
In short, is there anything I can do with my current setup, or
should I wait for five or six years until I'm out of school and can
afford to invest in this sort of equipment?

604. 48-Hours & Unidentified radio signals.

Newsgroup: rec.radio.amateur.space
Date: 1994-04-21 22:46:34 UTC
From: fsrla@aurora.alaska.edu
Message-ID: <1994Apr21.144634.1@aurora.alaska.edu>
Source record: 27908

This is probably the wrong news group to post this in.
If so, redirect me, please!!!!

Anyway, the show 48 Hours last night broadcast about
the search for UFO's. I found most of it rather hokey,
and (in all honesty) rather humorous.

What got my attention, however, was the segment on the
radio-telescope facility that was scanning the skies in
search of hopeful radio contact, or sounds, or, well,
anything out of the norm. They had 37 signals they
could not identify.

Now, my question is, does anybody know what frequencies
these 37 signals were heard on? I'm just curious.

Please e-mail me at FSRLA@aurora.alaska.edu
Thanks!

605. Yaesu FT-736R/AEA DSP-1232 interface problem

Newsgroup: rec.radio.amateur.space
Date: 1994-04-22 03:40:45 UTC
From: rdhoughton@vms4.sci.csupomona.edu
Message-ID: <1994Apr21.204045.1@clstcs>
Source record: 27909

I'm in the process of connecting a Yaesu FT-736R transceiver to an AEA DSP-1232 all mode controller with the intention of working PACSAT. I have the new version 7.00 firmware which supports modem 13 doppler correction for the radio. Unfortunately, if I'm reading the schematics properly, the AEA unit seems to expect that the up/down frequency buttons on the microphone operate by pulling a line to ground, while these buttons on the FT-736R seem to function by pulling a line to +5 volts in order to step the frequency up or down. Needless to say, that after following the AEA instructions (and resultantly pulling the +5 power supply to ground) my radio was not a happy camper. Luckily I got away without damage but I've decided to ask for help. There must be a lot of people out there who have run into this problem. The AEA rep was courteous but had no real answers. (I guess you'll have to build some kind of interface...)

If any of you have a simple solution to this problem, I'd love to hear from you.

Thanks for your help!

Bob Houghton, KC6LVG

Hi All,

I'm a Stanford graduate student in the Aeronautics program and
am building a satellite that will be launched hopefully sometime next year.
I plan on using a TNC for telemetry data. Since the majority of the
satellites use PSK, I plan on using a rad hard version of a paccom tiny 2.
I hear they use low power (CMOS) and are easy to hook up to a transceiver
(as opposed to 9600). First, are my decisions sound?
The satellite will be in LEO, and we do plan on downloading jpeg pics
(about 20K each). 8 - 15 minute windows.
Second, what can I do about data integrity? I hear there is a
protocol called pacsat that the uosat's use- is this an easily configured
code (we plan on launching a 68332), and if so where is it available.
If there is a better/easier protocol available let me know. My major concern
is to resume a download if the window is not long enough to retrieve a
picture.
Third, using a store bought TNC 1200 baud, will I have any problems
uploading. Will Doppler's effect be a problem?

Thanks in advance,

Rajesh Batra

You did not mention anything about frequencies. You can not use
amateur radio frequencies just because you have a license! There are
licensing procedures etc.

Ron w8gus.

613. Looking for the Satelite FAQ

Newsgroup: rec.radio.amateur.space
Date: 1994-04-22 15:09:15 UTC
From: dparker@netcom.com
Message-ID: <dparkerCoo23F.Fr6@netcom.com>
Source record: 27765

Well I read it, loved it, then did not save it. Now I cannot find it.
Would some kind person e-mail it to me?
Great information!
Many thanks in advance,
Dave

Looks like a job for a couple of general purpose PNP transistors.
Emitters to +5v, bases through current limiting resistors to the
modem control wires, and collectors to the radio control wires.
Presto! A simple inversion.

616. rec.radio.amateur.vhf.plus (?)

Newsgroup: rec.radio.amateur.space
Date: 1994-04-22 18:57:58 UTC
From: dragonsl@hebron.connected.com
Message-ID: <2p96nm$7k6@hebron.connected.com>
Source record: 27768
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.space,rec.radio.amateur.policy

rec.radio.amateur.vhf.plus should it be created?

This is a informal request to see if there is enough interest to warrant a new news group. The driving factors in this interest are, the apparent demise of the vhf list run out of Stanford University and the lack of any other news group for this area. The major unknown is if there is enough interest to set up a formal RFD/CFV for this area.

While my primary interest is in the weak signal area, I have also noticed a general need in areas of ATV, Repeaters, FM, etc. So I envision the charter as being read very broadly, to include all areas of VHF/UHF/SHF interest, except RC, satellite, and packet (as they have their own forums)

Please reply to me via email or to rec.radio.amateur.misc (also posted to rec.radio.amateur.space and rec.radio.amateur.policy)

619. Satellites without beams

Newsgroup: rec.radio.amateur.space
Date: 1994-04-22 20:27:06 UTC
From: wa4ymz@aol.com
Message-ID: <2p9buq$l9m@search01.news.aol.com>
Source record: 27771

I live in a rented house, and my landlord is pretty reasonable about letting me do some things, but I think he would draw the line at a tower or putting up beams or arrays on the roof. What are my options for satellite work? I don't mind adding hardware in the shack, but the stuff outside will be limited to dipoles, verticals, etc. Present equipment includes HF, 2M, and an old TNC-2 clone. I'll probably be replacing the TNC shortly, but the 2M is an Icom 251A and it will most likely be staying. Upgrading will be piece-by-piece. Suggestions are GREATLY appreciated. TNX.

620. High Altitude Balloon Flight in Denver Postponed

Newsgroup: rec.radio.amateur.space
Date: 1994-04-23 02:36:36 UTC
From: rickvg@cscns.com
Message-ID: <qc8kjSEHGUYZ057yn@cscns.com>
Source record: 27772

Forwarded from Ground Station Ops of EOSS:

The flight of EOSS 16 has been delayed until May 1, 1994.

Due to technical difficulties with the Ozone detection experiment being
conducted by Ranum High School, one week is needed to work out the problems.

All payload frequencies will remain the same.

Here is the updated fact sheet.

FLIGHT PROFILE FOR EOSS 16

LAUNCH DATE : May 1, 1994
LAUNCH SITE: Thunder Ridge Middle School
Picadilly and Smokey Hill Rd.
Aurora, Colorado, USA
LAUNCH SITE COORDINATES: 39.62305 deg North
104.73544 deg West
LAUNCH TIME : 9:00 a.m.
FLIGHT EXPERIMENT: Ozone detection at various levels of the atmosphere
EXPERIMENT CONDUCTED BY: Ranum High School, Longmont Colorado.
PROJECT INTEGRATOR: Andy Kellett/ N0SIS
SECONDARY EXPERIMENT: Testing of the APRS.
(Automatic Position Reporting System)

FREQUENCIES:

Shuttle I:
Telemetry 144.340 MHz
Beacon 147.555
ATV 426.250

HF Net:
7230khz Phone + or - QRM

Foxhunters:
CRA Repeaters 147.225 MHz

PURPOSE OF THE FLIGHT:
There are several experiments that are going to be run on the flight of
EOSS 16.

1. The primary experiment will be the detection of Ozone at various
altitudes above Colorado. This experiment will be conducted by Random
High School. The students are interested in the Ozone concentration and

may do a follow up flight to see if the levels have changed. They will be graphing the results and presenting them to the school science fair.

2. The second experiment will be the use of APRS (Automatic Position Reporting System). The controller will be sending down text strings that will include latitude and longitude in them which should plot the position of the payload on any APRS equipped packet station within the footprint of the balloon as the payload travels the skies of Colorado. The typical footprint extends to ALL neighboring states. So, if you are in southern Wyoming, south western Nebraska, western Kansas, western Oklahoma, northern Texas, parts of New Mexico and Arizona and Eastern Utah, look into tracking the progress of EOSS-16 with APRS. Of interest, noting the difference between Loran-C, which is used on Shuttle I, and GPS, which is used on Shuttle II.

In the Denver Metro Area check on my BBS, N0VSA-1 and find out where to get the APRS program.

From the APRS documentation:

THE LATEST APRS is posted on 410-280-2503 BBS. After version 3.11 I will also always post a file similar to: 400to401.zip which will contain only the files that changed in the lastest release.

Anyone interested is welcome to come to the launch site and experince what a EOSS flight is like. We will have the ground station computer set up and also have TV monitors set up so you can see the flight from the perspective of the payload's onboard B&W tv camera. After the payload has been launched there will plenty of people around to answer any questions that you may have.

Hope to see you there!!

While I don't really know if there is enough interest, I would probably subscribe to it. Two suggestions though-

1) Rename to rec.radio.amateur.vhf-plus You will find this a lot more acceptable to sysadmins as it prevents another "layer" from being created. Further, it makes more sense from a hierarchical perspective.

2) Try starting up an alt.radio.amateur.vhf-plus first and see how it does, this requires no votes, etc. and will tell you whether or not support is there for a group in the "real" usenet. (I can probably help with this if you need it.)

Anyway, those are just a couple suggestions.

Since I (loosely) run the vhf+ mailing list, I figured I'd better comment
here.

I started the list about two years ago, maintaining it by hand instead of
setting up some sort of automated listserver. This had both good and bad
consequences; I was able to exercise some judgement over what went over
the list, but I don't have enough free time these days to maintain it.
Part of the problem was that most of the list requests I received indicated
an interest in FM and Repeaters, which is *not* within the scope of the list.

I've considered starting an RFD for a newsgroup from time to time, but given
the fairly low level of traffic on the list (which has a fairly high signal
to noise ratio) I'm not sure this is desirable. Sooo...

I'll see if I can come up with some sort of automated listserver this
weekend, and set it up. If folks really want to set up a newsgroup, that's
okay too; I probably won't tie the two together.

623. Orbit DETERMINATION software ??

Newsgroup: rec.radio.amateur.space
Date: 1994-04-23 20:18:31 UTC
From: zvikal@ccsg.tau.ac.il
Message-ID: <1994Apr23.201831.2532@aristo.tau.ac.il>
Source record: 27775

Hi all. In recent weeks I have searched many ftp sites for orbit determination software - that is, software for calculating the orbit parameters of the sattelite given data such as measured Ra and Dec from a given ground stations(s), or doppler (i.e. velocity) readings from such stations. While there are many excellent shareware packages available for orbit calculation or tracking (that is, given the orbital parameters where will the sat be at time T), I have failed to find any for my 'Inverse' problem. Any info will be of help.

Thanks,
Zvi

38 To be launched on need in FY '94
33 To be launched on need in FY '94
40 To be launched on need in FY '95
30 To be launched on need in FY '95

Notes
1. NASA Catalog Number is also known as NORAD or U.S. Space Command object number.
2. No orbital plane position = satellite no longer operational.
3. Clock: Rb = Rubidium; Cs = Cesium
4. S/A had been enabled on Block II satellites during part of 1990; S/A off between about 10 August 1990 and 1 July 1991 due to Gulf crisis; standard level re-implemented on 15 November 1991. Currently, PRN15 and PRN20 appear to have little or no S/A imposed.
5. Anti-spoofing was activated on 94-01-31 at 00:00 UT on all Block II satellites. (ref. NANU 050-94042)
6. PRN number of SVN32 was changed from 32 to 01 on 93-01-28.
7. PRN03 was set unhealthy on 94-02-27 at 03:20 UT. It was unusable beginning at 02:33 UT on 94-02-27 and remained so until set permanently unusable on 94-04-13 beginning at 15:00 UT due to navigation payload shut down. (ref. NANU 083-94059 and NANU 129-94104)
8. The decommissioning date for PRN06/SVN03 is the date of termination of operations of this satellite (ref. USNO) and is about 3 weeks later than the date GPSIC gives for "deactivation".
9. The PRN06/SVN36 launch included the SEDS-2 tether experiment on the Delta II rocket body (object 23028, 1994-016B). The tether was broken by an impact on 94-03-15. The SEDS-2 end mass subsatellite and about half of the tether re-entered within a few orbits. About 11 km of tether remains attached to the Delta rocket which is still in orbit. (ref. Jonathan McDowell)
10. PRN13 was set unhealthy on 94-02-27 at 13:02 UT and will remain unusable until further notice due to "end of life testing." (ref. NANU 083-94059 and USNO). It is unlikely that PRN13 will return to service. (ref. USNO)
11. The degraded C/A-code performance of PRN19 was corrected effective 94-01-04 at 00:00 UT. (ref. NANU 343-93294, NANU 396-93337, and NANU 006-94010) The correction involved a switch to redundant systems on the satellite. (ref. Aviation Week & Space Technology)

WD0E ATTENDS JAMSAT SYMPOSIUM

HR AMSAT NEWS SERVICE BULLETIN 113.01 FROM AMSAT HQ
SILVER SPRING, MD APRIL 24, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-113.01

WD0E Attends JAMSAT Symposium

Jim White (WD0E) reports the annual JAMSAT Symposium was held in Tokyo on 27-MAR-94. Jim attended representing AMSAT-NA and presented a paper on MICROSAT construction and operation, the Deep Space Exploration Society (DSES) radio telescope project at Table Mountain near Boulder, CO, and the high altitude balloon experiments of the Edge of Space Sciences (EOSS) group. The day long symposium included presentations on the construction and use of quadrifiler helices, a version of the MICROSAT ground station software implemented in Japanese, and several presentations regarding Phase-3D. One of the Phase-3D presentations included a live demonstration of the prototype camera and electronics for the SCOPE project that will provide imaging capability aboard the satellite. Jim reports he was particularly impressed by the progress on SCOPE and the demonstration of the capabilities of the camera and electronics. Presenters included JA2PKI, JR1SWB, JM3MAJ, JA0FKM and JH7CKF. An award was presented to Sumio Nakane (JH3BJN) for achieving satellite DXCC using only a four element antenna for 2M, a most impressive accomplishment.

The evening prior to the Symposium, JAMSAT held a celebration of their 20th anniversary. Jim reports the hospitality was outstanding with great international camaraderie and a good deal of discussion about satellite construction and operation. Jim said he was particularly grateful for the hospitality and translation services of Sumio Nakane, Miki Nakayama, and Tak Okamoto.

AMSAT-NA congratulates JAMSAT on its 20th anniversary!

UNAMSAT Status Report

David Liberman (XE1TU) project manager for UNAMSAT at the Autonomous University of Mexico, is resting at home recovering from hepatitis. Meanwhile according to Hector Sosa, chief software engineer for UNAMSAT, the entire student group that has been working on the construction project of their UNAMSAT-1 MICROSAT for about two years, recently obtained their ham tickets after they all took the exam for their amateur radio licenses and have now received their call-signs. The new licensees are:

Jose Garcia XE0IKQ
Juan Zavala XE0MMF
Hector Rojas XE0LFD
Gabriel Garcia Gama XE0JMC
Saul de la Rosa Nieves XE0RAI
Eloy Martinez XE0IKZ
Carlos Wallenius XE0JPM

Those who might want to wish XE1TU a speedy recover may send cards to:

David Liberman (XE1TU)
Bosque de Sayula #22

AMSAT-UK Colloquim Call For Papers

The ninth AMSAT-UK Colloquium will be held July 28-31 at the University of Surrey in Guildford, Surrey, England. This year's colloquium will be divided into four primary topic areas: spacecraft engineering, future space missions, groundstation and spacecraft operations and associated amateur space activities. Papers falling into these categories are sought for the event. Authors should submit abstracts to arrive no later than May 10, 1994 for consideration for this year's event with full paper submissions due by June 10, 1994. Authors will be notified of paper acceptance by June 1. Abstracts should be sent to:

Doug Loughmiller, G0SYX
AMSAT-UK Colloquium Programme Chairman
University of Surrey
Centre for Satellite Engineering Research

Guildford, Surrey
GU2 5XH
England

Submissions can also be made to the program chairman via fax on +44 0483 259503 or via the Internet to: D.loughmiller@ee.surrey.ac.uk

Abstracts and papers should only be sent to the addresses listed above.

The annual AMSAT-UK Colloquium is the largest international gathering of amateur satellite enthusiasts and experts in the world and has established a high standard of quality presentations on topics relevant to the amateur satellite community. Organiser's of this year's event would welcome all contributions of program material covering the vast scope of the amateur satellite program as it exists in 1994. The ninth AMSAT-UK Colloquium promises to be the most informative and entertaining event yet. We look forward to your participation in this year's Colloquium. See you in Surrey!

AO-13 OPS NET SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 113.04 FROM AMSAT HQ
SILVER SPRING, MD APRIL 24, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-113.04

Current AMSAT Operations Net Schedule For AO-13

AMSAT Operations Nets are planned for the following times. Mode-B Nets are conducted on AO-13 on a downlink frequency of 145.950 MHz. If, at the start of the OPS Net, the frequency of 145.950 MHz is being used for a QSO, OPS Net enthusiasts are asked to move to the alternate frequency of 145.955 MHz.

Date UTC Mode Phs NCS Alt NCS
30-Apr-94 2130 B 176 W9ODI VE2LVC
09-May-94 0000 B 175 W5IU WA5ZIB
14-May-94 1700 B 167 WA5ZIB W5IU
21-May-94 2130 B 185 VE2LVC W9ODI

Any stations with information on current events would be most welcomed. Also, those interested in discussing technical issues or who have questions about any particular aspect of OSCAR statellite operations, are encouraged to join the OPS Nets. If neither of the Net Control Stations show up, any participant is invited to act as the NCS.

Slow Scanners are invited to join the SSTV sessions on AO-13. The frequency is 145.955 MHz. The net meets at 45 minutes before Mode S, and on Mode B following Mode S on Saturdays and Sundays. Join those sessions or convey your wishes for other SSTV skeds to wb6llo@amsat.org, and he will coordinate your efforts.

AMSAT BOOTH AT DAYTON

HR AMSAT NEWS SERVICE BULLETIN 113.05 FROM AMSAT HQ
SILVER SPRING, MD APRIL 24, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-113.05

Look For The AMSAT Booth At The Dayton Hamvention Next Weekend

For those of you who are going to be at Dayton, we look forward to seeing you. The AMSAT booth is in the same spot as last year, 445 - 448.

AMSAT will be holding three sessions during the weekend. On Friday at 1:00 PM in Room 1, "Getting Stated on the Satellites, Including the Packet Birds." This will be moderated by Keith Baker KB1SF. There are two sessions on Saturday, both in Room 5. AT 1:00 PM the SAREX session features several astronauts plus Roy Neal (K6DUE). And at 3:15 PM, learn all about the progress on Phase 3D from Dick Jansson WD4FAB, our VP for Engineering. Dick is working very closely with all the various individuals and groups participating in the construction of the satellite and will bring us up to date on how everything is going.

This being the 10th anniversary of the first "Ham in Space" and the 25th anniversary of the founding of AMSAT, this is a very big year for us. Try to participate in as many of the AMSAT-related functions as you can.

We will be holding an informal dinner and get-together Friday evening. Come by the booth after the Hamvention opens Friday noon and sign up. The restaurant can accommodate only those who sign up.

Communications

The Upper Valley Radio Club in Fairborn has graciously invited us to use their two repeaters while we are in the area. The 2 meter one is on 145.41 (-) and the 70 cm machine is on 442.375 (+). Both are located on a water tower not more than a half mile from the Homewood Suites, where many AMSATers are staying. So, handi-talkies on low power ought to work nicely in that area.

Of course, DARA will run their usual talk-in on 146.94 (-). If you can get through the mob, they do a good job of providing directions.

Around the Hara Arena, and at other locations where we need to communicate :via simplex, AMSAT will use 145.55. I am sure that it won't be clear, but no 2 meter frequency is clear during Hamvention. For those with 70 cm HTs, I suggest 438.00. Mine seems to work there.

I understand from Keith Baker KB1SF, who lives in the Dayton area, that road construction in and around Dayton is particularly troublesome this year. I-75 is reported to be torn up, and down to one lane; BOTH north and south of Needmore Road (the main way to the arena). Also, I-675 north and south are torn up, and down to one lane, in spots. This is the route from I-70 down to the Hoomwood Suites in Fairborn, where most of us will be

staying. So, wherever you're going around Dayton, give yourself plenty of time.

Travel safely and we'll see you next week!

73,

Bill Tynan (W3XO)
AMSAT-NA President

Mode-S : MA 220 to MA 230 |<- S transponder; B trsp. is OFF
Mode-BS : MA 230 to MA 250 | Blon/Blat 230/-5
Mode-B : MA 250 to MA 256 |
Omnis : MA 250 to MA 120 | Move to attitude 180/0, Jul 11
[G3RUH/DB2OS/VK5AGR]

FO-20: The following is the current schedule for transponder operations:
ANALOG MODE:
20-Apr-94 7:35 -to- 27-Apr-94 7:55 UTC
11-May-94 6:54 -to- 18-May-94 7:20 UTC
Digital mode: Unless otherwise noted above.
[Kazu Sakamoto (JJ1WTK) qga02014@niftyserve.or.jp]

KO-23: Working well. [WH6I]

KO-25: Working well. WH6I reported in last week's KO-25 status report that number of new images can be found on KO-25 but since the wide angle images are in a new format that so far has not been decoded. Well since then he reports that the QUIKDISP.EXE is available on KO-25's BBS for downloading. This is a program that will display the new wide angle views from KO-25. WH6I is in the processing downloading several earth image files. He says that the file KAIW0008 appears to be on the adriatic coast of the former Yugoslavia. [WH6I]

AO-16: Working well. [WH6I]

DO-17: ZR5JRS finds this to be an excellent satellite to monitor as he can receives DOVE with 599 signals when it is at an elevation of

only 7 degrees. To date, however, he has not heard the digital voice. [ZRTJRS]

UO-11: This satellite is working well with clear, readable RTTY. The digital voice also is received well from ZR5JRS's QTH. ZR5JRS observes that he has to wait until UO-11 is at lest 25 degrees above the horizon for him to receive a good copy on UO-11. He notes that this is in contrast to the other OSCAR satellites which he copies almost immediately after they rise above his horizon. His only theory about this is that perhaps UO-11 runs considerably less power than the other OSCARs. [ZR5JRS]

MIR: Over the last 4 days, the MIR BBS has been switched off. This is possibly to prevent clashes with the STS-59 SAREX mission. However, before this, it was relatively easy to access the MIR BBS even using 2 watts of power at an elevation of 18 degrees with a "Slim Jim" antenna. There have been no reports of voice contacts in South Africa that ZS5JRS is aware of over the last 14 months.
[ZR5JRS @ ZR5GQ.NTL.ZAF.AF]

RS-10/11: Of all the OSCAR satellites, this satellite is ZR5JRS's favorite one to work. His station consists of a 10W Yaesu FT-480R with a "Slim Jim" antenna for the uplink, and an old Yaesu FTDX 400 with a long wire antenna for the downlink. From his QTH in Durban, grid square KG59MG, he can work stations in Cape Town, which is about 1300 KM away and stations Johannesburg which is about 500 KM away at the same time for about 3 to 4 minutes. JR5JRS has also found that the downlink is about half as strong as the beacon signal. He also uses the beacon signal to gauge cond-itions on the 10M band, sometimes hearing the beacon up to 10 minutes after the satellite has gone below the horizon!
[ZR5JRS @ ZR5GQ.NTL.ZAF.AF]

The AMSAT NEWS Service (ANS) is looking for volunteers to contribute weekly OSCAR status reports. If you have a favorite OSCAR which you work on a regular basis and would like to contribute to this bulletin, please send your observations to WD0HHU at his CompuServe address of 70524,2272, on INTERNET at wd0hhu@amsat.org, or to his local packet BBS in the Denver, CO area, WD0HHU @ W0LJF.#NECO.CO.USA.NOAM. Also, if you find that the current set of orbital elements are not generating the correct AOS/LOS times at your QTH, PLEASE INCLUDE THAT INFORMATION AS WELL. The information you provide will be of value to all OSCAR enthusiasts.

/EX

630. Weather Sat freqs.

Newsgroup: rec.radio.amateur.space
Date: 1994-04-25 07:25:24 UTC
From: boyer@rd.eng.bbc.co.uk
Message-ID: <Cot0MD.Hy3@bbc.co.uk>
Source record: 27786

I am trying to put together a list of frequencies for the low orbit
weather satelites. Such as NOAA Meteosat etc. If anyone has freqs please post
them to me and I will compile a 'definitive list' and post it on the net.
It might also be an idea to state what mode (apt or hrpt) is transmitted on
any frequencies listed.

: a given ground stations(s), or doppler (i.e. velocity) readings from such
: stations. While there are many excellent shareware packages available for
: orbit calculation or tracking (that is, given the orbital parameters where
: will the sat be at time T), I have failed to find any for my 'Inverse'
: problem. Any info will be of help.

634. Two-Line Orbital Element Sets (TLE383)

Newsgroup: rec.radio.amateur.space
Date: 1994-04-25 23:58:40 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.767318320@afit.af.mil>
Source record: 27791

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

635. Radio Astronomy

Newsgroup: rec.radio.amateur.space
Date: 1994-04-26 09:28:17 UTC
From: "J Paul Lesso"@ee.ed.ac.uk
Message-ID: <Cov0z7.69A@festival.ed.ac.uk>
Source record: 27788

Keywords: radios n stuff

I enjoy astronomy as a hobby but have recently become interested in
radio astronomy, speciifically listening to Jupiter 20MHz and also the bands
that can be used to listen to meteors. Any FTP sites, publications or any
help would be most appreciated!

TIA

Paul

636. STS-xx QSL routes??

Newsgroup: rec.radio.amateur.space
Date: 1994-04-26 15:17:12 UTC
From: hardie@herald.usask.ca
Message-ID: <2pjb9o$q2i@tribune.usask.ca>
Source record: 27789

Some time ago somebody posted a list of the QSL routes for all the shuttle missions so far. I carefully saved the file and then equally carefully deleted it.
Specifically, I need the QSL route for STS-60 for a packet contact but would like the whole list if it's still around.
Thanks
Pete

638. FT-726R SAT RIG FOR SALE, ALSO ICOM 275A

Newsgroup: rec.radio.amateur.space
Date: 1994-04-26 23:12:10 UTC
From: BIDDLEAP@ctrvax.Vanderbilt.Edu
Message-ID: <1994Apr26.231210.6818@news.vanderbilt.edu>
Source record: 27521

More shack cleaning.

For sale:

Yaesu FT-726R All mode multiband tranceiver.

Includes:

HF module (15-12-10 meters)
2 meter module
70 cm module (430-440 MHz)
Full duplex (for satellite use)
All manuals
Standard hand mike
MD-1B8 desk mike

It is in excellent condition, both electically and
mechanically, and was used for both analog and digital ham
satellites, as well as terrestrial packet.

Package deal only. $850 including shipping.

.....
Icom 275A 2 meter all mode tranceiver.
Used only a couple of hours. Absolutely mint. Everything in
original box. About 2 years old. I just don't need two of
them. (Please don't ask! :>)

$800 including shipping.

....routinely work RS-10/11 with 10 watts.

Thanks, Paul. That looks like it will be my first shot. I've got an Isopole for 2M so I'm set. 29 MHz antenna is an R-7. From my location, RS-12 is much louder than RS-10 even though both are 10M downlink. HF rig is a TS-690, so the receive should be pretty good. Any reason for the disparity that you know of? Are you using a pre-amp? Any suggestions? Tnx.

One good beginners reference is the "Amateur Radio Astronomer's
Handbook" by John Potter Shields (ISBN 0-517-55810-6). Published in
1986, it has some good introductory information on radio astronomy
history, theory, and observing (including chapters on receiving
18-22 MHz signals from Jupiter and meteor signals). Good luck!

I read alittle while back about being able to operate Ao21 via low power?
If so can anyone give me info on it I'll like to give it a shot
I'm working the grave yardshift so I have the wee hours of the morning to
give it a shot.

I know there was talk about trying it late in the morning when most operators are asleep
and not to many big stations are up and running, Any help??

Me too.

> If so can anyone give me info on it I'll like to give it a shot

I tried it. 50W ERP and no sign of a signal being relayed. I heard (on Sunday)
a 'local' through the bird, and I could hear his uplink signal, too. He was
just about fully readable via satellite. I asked him about his setup, and
what he described equated to roughly 1.4KW ERP. On that basis, I'll stay
listening :-(

Please don't do this! Alt.* is not a trial hierarchy.

If you think there is enough traffic for a rec group, then put
in the RFD for it. (A pre-existing mailing list is a great way
to demonstrate such traffic).

If it fails the vote, *then*, by all means, propose the alt group.
This would be a much more legitimate use for alt.* and will help
keep it less cluttered.

Followups to news.groups, where this discussion belongs.

ARLS021 Another SAREX success

Another SAREX success

During the just-completed shuttle mission, STS-59, astronauts Jay
Apt, N5QWL, and Linda Godwin, N5RAX, used their SAREX 2-meter
equipment for a contact with Astronaut Ken Cameron, R3/KB5AWP, on
assignment at the Russian space facility at Star City, near Moscow.

The two astronaut-hams also spoke to cosmonaut Anatoli Artsibartski,
U6MIR. The contacts were made on two successive passes overhead.

Jay Apt said ''Ken is my friend and former STS-37 crewmate. It was
terrific to hear his voice after several months corresponding by
e-mail only. What a great way to use ham radio.''

Cameron and Artsibartski were standing near the Star City statue of
Russian cosmonaut Yuri Gagarin, using a hand held transceiver and
5/8 wavelength whip antenna, standing on a car to increase their
elevation, astronaut Jay Apt related in an Amateur Radio packet
message from space.

Astronauts at HamVention

A space forum at the Dayton HamVention will feature two NASA shuttle astronaut-hams, Tony England, W0ORE, and Steve Nagel, N5RAW. The forum will commemorate 10 years of Amateur Radio aboard the shuttles.

Tony England flew on the second ham radio mission, in 1985, while Steve Nagel, a veteran of several shuttle flights, most recently commanded shuttle flight STS-55 in 1993. The two will discuss their Amateur Radio experiences from space and answer questions.

Also at the forum will be members of the ARRL SAREX Working Group, including ARRL Educational Activities Manager Rosalie White, WA1STO, and Roy Neal, K6DUE, a principal coordinator of the shuttle Amateur Radio project.

The forum is scheduled for 1 PM on Saturday, April 30, in Forum Room 5 at Hara Arena.

HR AMSAT NEWS SERVICE BULLETIN 106.04 FROM AMSAT HQ
SILVER SPRING, MD APRIL 16, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-106.04

Weekly OSCAR Status Reports: 16-APR-94

AO-13: Current Transponder Operating Schedule:
M QST *** AO-13 TRANSPONDER SCHEDULE *** 1994 Apr 07-Jul 11
Mode-B : MA 0 to MA 170 |
Mode-BS : MA 170 to MA 218 |
Mode-S : MA 218 to MA 220 |<- S beacon only
Mode-S : MA 220 to MA 230 |<- S transponder; B trsp. is OFF
Mode-BS : MA 230 to MA 250 | Blon/Blat 230/-5
Mode-B : MA 250 to MA 256 |
Omnis : MA 250 to MA 120 | Move to attitude 180/0, Jul 11
[G3RUH/DB2OS/VK5AGR]

FO-20: The following is the current schedule for transponder operations:
ANALOG MODE:
20-Apr-94 7:35 -to- 27-Apr-94 7:55 UTC
11-May-94 6:54 -to- 18-May-94 7:20 UTC
Digital mode: Unless otherwise noted above.
[Kazu Sakamoto (JJ1WTK) qga02014@niftyserve.or.jp]

STS-59: To obtain a QSL, either as a result of a SWL or for a QSL, send your report or QSL to ARRL EAD, STS-59 QSL, 225 Main Street, Newington, CT 06111, USA. Include the following information in your QSL or report: STS-59, date, time in UTC, frequency and mode (FM voice or packet). In addit-ion, you must also include an SASE (or sufficient IRCs) using a large, business-sized envelope if you wish to receive a card. The Orange Park Amateur Radio Club in Florida has generously volunteered to manage the cards for this mission. [Bob Inderbitzen (NQ1R) Assistant to the Manager, ARRL Educational Activities]

KO-23: Working well and has a new pair of images. [WH6I]

KO-25: Working well. A number of new images can be found on KO-25 but since the wide angle images are in a new format that so far has not been decoded, and since narrow angle images are very hard to locate in the absence of the companion wide angle image there is very little to get out of the images that are available. [WH6I]

AO-16: Working well. WH6I notes that usage on the 1200 baud OSCARS has has dropped off considerably. [WH6I]

LO-19: Working well. [WH6I]

The AMSAT NEWS Service (ANS) is looking for volunteers to contribute weekly OSCAR status reports. If you have a favorite OSCAR which you work on a regular basis and would like to contribute to this bulletin, please send your observations to WD0HHU at his CompuServe address of 70524,2272, on INTERNET at wd0hhu@amsat.org, or to his local packet BBS in the Denver, CO area, WD0HHU @ W0LJF.#NECO.CO.USA.NOAM. Also, if you find that the current set of orbital elements are not generating the correct AOS/LOS times at your QTH, PLEASE INCLUDE THAT INFORMATION AS WELL. The information you provide will be of value to all OSCAR enthusiasts.

****
THE JOVIAN DECAMETRIC EMISSION AND THE COLLISION OF COMET SHOEMAKER-LEVY 1993e.

The Jovian Decametric Emission.

The Jovian decametric emission was discovered in 1955 by B.F. Burke and K.L. Franklin at the frequency of 22.2 MHz. The emission has an upper cutoff frequency of 39.5 MHz. It can be detected from ground based stations from the upper cutoff frequency of the emission down to the cutoff frequency of the terrestrial ionosphere which is usually around 5 to 10 MHz. The peak of the intensity of the emission occurs at around 8 MHz. The emission occur in episodes called "storms". A storm can last from a few minutes to several hours. Two distinctive types of bursts can be received during a storm. The L bursts (L for Long) are bursts that vary slowly in intensity with time. They last from a few seconds to several tens of seconds and have instantaneous bandwidth of a few MHz. The S bursts (S for Short) are very short in duration, have instantaneous bandwidth of a few kHz to a few tens of kHz, and drift downward in frequency at a rate of typically -20 MHz/sec. They arrive at a rate of a few to several hundred bursts per second. In a 5 kHz bandwidth receiver they last only a few milliseconds. Sometimes both types of bursts can be heard simultaneously. The emission is believed to be beamed into a thin hollow cone with axis parallel to the direction of the magnetic field lines in the region where the emission originates (near the magnetic poles). The probabilities of detecting the emission depend strongly on the values of the Jovian central meridian longitude (CML), the Io Phase, and the Jovicentric declination of the Earth (DE). The CML is the value of the System III longitude of Jupiter facing the Earth. The Io Phase is the angle of Io, one of Jupiter's moons, with respect to superior geocentric conjunction. The regions in the CML-Io phase plane that have increased probabilities of emission are called sources. The sources are named Io-A, Io-B, and Io-C for the Io-controlled emission and A, B, and C for the Non-Io controlled emission.

Source CML Io Phase Characteristics of emission

Io-related sources
Io-A 200-290 195-265 RH polarized, mostly L bursts
Io-B 90-200 75-105 RH polarized, mostly S bursts
Io-C 290-10 225-250 LH polarized, L and S bursts

Non-Io related sources
A 200-290
B 90-200
C 290-10

The Collision of Comet Shoemaker-Levy 1993e and the Possible Effects on the Low Frequency Radio Emission.

Comet Shoemaker-Levy 1993e will impact Jupiter between July 16 and 22, 1994. Extreme tidal forces exerted by Jupiter broke the nucleus up into at least 21 fragments during a close pass by the planet about two years ago. The largest of the fragments are about 2 to 4 km in diameter. Over a period of about six days, each fragment will penetrate Jupiter's magnetosphere and explode at about the cloud-top level of the atmosphere, creating a fireball that may rise to the altitude of Jupiter's ionosphere. Since the fireballs will occur just beyond Jupiter's limb as viewed from the Earth, they will not be visible unless they rise to unexpectedly great heights.
It is not known whether the passage of the fragments through the magnetosphere and their collision with Jupiter will create radio emissions that are detectable from Earth. An electric field will be induced in the nuclei as they pass through the Jovian magnetic field, an effect similar in nature to that experienced by the satellite Io. However the plasma density around the comet and the magnitude of the electric field induced may be too low and cause only weak radio emission (unless something unexpected happens that could suddenly increase the amount of ionized gas around the comet). Several suggestions has been made regarding the possibility of emission at different stages of the passage and entry into the jovian ionosphere and atmosphere. One suggestion is that the interaction of the fragments with the Jovian ionosphere may trigger decametric emission in the last 10-20 seconds before the explosion. Another suggestion is that low frequency electromagnetic radiation could be emitted by the plasma released during the fireball. In this case the emission may be in the form of short pulses of electromagnetic radiation. Another possibility is the stimulation of lighting discharges from lower altitudes after the fireballs have developed. This emission may be in the form of almost continuous noise originating in the possible large number of lightings discharges. Since the fireball will occur on the far side of the planet it is unlikely that direct radio emission could be detected from ground based observations. There have been suggestions that ducting of the radio emission in the layered ionosphere around the limb of the planet might make possible its detection from Earth. Apparently no estimates for the intensity of these types of

emission are yet available.
Still one more possibility is that plasma released by the comet and plasma generated by the fireball may affect the well known decametric emission. If this plasma diffuses along lines of magnetic field and reaches the region where the decametric emission is generated, it may alter the probabilities of emission or it may have a quenching effect of the emission in particular at the low frequencies. These changes in the behavior of the decametric emission may not be easily detectable, at least for an occasional observer. It will be necessary to make systematic observation of the emission for several months prior to the collision in order to establish a baseline for the probabilities, the intensity, bandwidth, etc. of the emission. As was mentioned above, the decametric emission is sporadic but the probabilities of receiving the emission are larger for some particular configurations of central meridian longitude (CML) and Io phase. Careful radio observations will be made from various locations in an attempt to ascertain which of these situations prevail during the impacts. Whatever information can be determined in this way will be of great value in the investigation of the origins of Jupiter's radio emissions.
The University of Florida Radio Observatory (UFRO) has been observing the Jovian decametric emission since 1957. For the present apparition the UFRO started observing in January, 1994 at several frequencies between 18 to 32 MHz. The observations will be extended through at least August to be able to observe during the collision of comet Shoemaker-Levy 9 with Jupiter.

Observing the Jovian Decametric Emission.

There have been reports of detection of the Jovian decametric emission with simple half wavelength dipole antennas or low gain antennas such as the long-wire type or loop antennas. Such low gain antennas may allow the detection of only very strong bursts. Antennas with gains of 6-10 dB with respect to a half wavelength dipole are more suitable for detecting the emission. Yagi (5-elements) and log periodic antennas usually have gains in this range. These higher gain antennas connected to HF amateur radio receivers can easily detect most of the strong part of the Jovian decametric radio emission. It will be necessary for good reception of Jupiter that the antenna points towards the planet. This may be difficult since most amateur antennas only have azimuthal control. Most amateur HF radio receivers are suitable for detecting the emission since they have a relatively narrow passband and adequate noise figure. The relative narrow band of these receivers will help in tuning away from radio stations. It will be necessary to disable the AGC of the receiver otherwise the signal will be badly compressed. An observing frequency between 18-22 MHz is recommended. At frequencies below 18 MHz strong interference from stations and static is expected. At frequencies higher than 22 MHz, the probabilities of detecting

the emission drop sharply because of the drop in intensity of the emission (see attached histogram of occurrence probability). Although the low solar activity expected for this year is a favorable condition for detecting the emission during the period of the collision, the low value of DE (around -3.4 degrees for July, 1994) reduces the probabilities of detection.

As a reference, the minimum detectable flux density (power per unit area per unit bandwidth) expected for an 8 dB gain linearly polarized antenna connected to a receiver having a 5 kHz bandwidth and an output time constant of 1 second is of the order of 5X10^-22 wm^-2Hz^-1 at a frequency of 18 MHz. Jovian decametric radio emission with peak flux densities in the range of 10-100X10^-22 wm^-2Hz^-1 are common. Expressing the flux density in Jansky (Jy), a unit more commonly used in radio astronomy, these peak flux densities are 100,000 to 1,000,000 Jy (1 Jy= 1X10^-26 wm^-2Hz^-1). In terms of power and voltage at the input of a receiver,10x10^-22 wm^-2Hz^-1 is equivalent to a power of 1x10-9 microwatt or 0.23 microvolt over 50 Ohms.

A few more additions need to be considered if the information gathered is to used for scientific purposes. A source of calibrated noise is necessary in order to calibrate the intensity of the signal. As an example, an HP 461A amplifier can be used as a noise source (with a variable attenuator), but the noise temperature of the amplifier must be calibrated against a standard noise source such as the type 5722 current-saturated noise diodes. Timing information is also an important consideration. WWV timing signals can provide adequate timing information. The ability to identify the Jovian emission and separate it from stations, static, or other types of interference is also important. Recording of the receiver output in paper chart records provide a nice way of monitoring the emission. The chart records can be used for further data reduction and analysis, but their use is sometimes time consuming. A personal computer with an A/D converter will provide a better way to store, retrieve, and process the information (if further data reduction and analysis are to be made). Time constants of about 1 second are adequate for recording the envelope of the emission. Shorter time constants (10-20 milliseconds or shorter) are necessary to resolve the faster S bursts.

The University of Florida Radio Observatory (UFRO) has generated a listing of the prediction of the configurations of CML, Io Phase, the active sources, and the probabilities of emission at 26.3 MHz for the months of April, May, June, July, and August, 1994. The probabilities at 26.3 MHz are valid for an antenna of large collecting area (These probabilities were obtained with the 640 dipoles of the UFRO 26.3 MHz Large Array), and are included as reference only. Probabilities at 18 MHz and other frequencies (obtained with Yagi antennas with gains around 8 dB) may be added later. For those having access to Internet, the files containing a short explanation and the predictions are

accessible at the ftp site astro.ufl.edu; the files are in the
pub/jupiter directory and are called README.DOC and april94.txt,
may94.txt, june94.txt, july94.txt, and aug94.txt. Questions or
comments regarding the predictions can be sent to L. Garcia at
garcia@astro.ufl.edu.

652. SAREX and Baycom ?

Newsgroup: rec.radio.amateur.space
Date: 1994-04-28 21:05:21 UTC
From: mac20@bonjour.cc.columbia.edu
Message-ID: <2pp8eh$ega@apakabar.cc.columbia.edu>
Source record: 27805

I have not had much luck (read; any) trying to connect to a number of different shuttle missions in the last year or more.
we have a decent satelite antenna tower and 25 watts out and i'm wondering if i'm doing anything systematically wrong.

- Our "all-mode" 2 meter only allows 5 KHz step increments, this isn't fatal is it?

- What parameters are recommended for Baycom? is this anything different then a full TNC? how frequently should you send out your packets in this duplex situation?

- Anyone know of any partiuclarly useful incantations i should be reciting?

Fortitude is a better term then banging your head against the wall.

653. Re: Ao-21 via mobile?

Newsgroup: rec.radio.amateur.space
Date: 1994-04-29 05:43:47 UTC
From: dt650@cleveland.Freenet.Edu
Message-ID: <2pq6qk$99f@usenet.INS.CWRU.Edu>
Source record: 27806

Re AO-21 Mobile: I normally work OSCAR 21 with about 20 watts into a six element beam, but I've gotten into the satellite twice with 20 watts into a dual band whip mounted on the trunk of my car.

The first time, the bird was almost directly overhead - at least 80 degrees above the horizon. It was about 2:00 AM CDT and the downlink was completely quiet - nobody was using it at all. I gave a "what the heck" call and was startled to hear myself on the downlink. I called CQ and N7POR came back to me from Seattle. We had about a fifteen second QSO before I lost the bird. I was parked between two minivans at the time, which may have acted like reflectors.

The second time was at 11:05 UT, to WA2GSY in N.J. AO-21 was about 60 degrees above the horizon then, to the east of my WI QTH.

I also remember talking to Joe barefoot while driving home from work one morning, but I can't find it in my log. I do remember that he had to fight to hear me and that I checked the satellite's position when I got home and it was over Michigan at the time.

An article in the AMSAT magazine last year tells how a guy has made many contacts from his mobile. I can't remember what power he was using, but I remember that he bent his whip back at an angle to help elevate his signal.

A columnist in 73 magazine made a QSO with a guy in Cleveland using an HT once, too. He said he held it over the roof of a Volkswagon to use it as a reflector.

Anyway, it _can_ be done, but it's not easy.

Source record: 27807

I had similar problems...i think the reason is that the baycom
software cannot understand the "UA,S" -packet sent by shuttle.

I didnt try GP+TFPCX, because it doesnt decode noisy signal as
well as baycom does, instead i tried working with normal TNC-
no problems...

* AMSAT-UK COLLOQUIUM NEWS *
============================
AMSAT-UK Colloquium Call for Papers

The ninth AMSAT-UK Colloquium will be held July 28, 29, 30 & 31 at the University of Surrey in Guildford, Surrey (England). This year's colloquium will be divided into four primary topic areas: Spacecraft Engineering, Future Space Missions, Groundstation and Spacecraft Operations and Associated Amateur Space Activities. Papers falling into these categories are sought for the event. Authors should submit abstracts to arrive no later than May 10, 1994 for consideration for this year's event. Papers accepted for this year's proceedings will be required in final form (camera ready or on disk) no later than June 10, 1994. Authors will be notified of paper acceptance by June 1.

Abstracts should be sent to:

Doug Loughmiller, G0SYX
AMSAT-UK Colloquium Programme Chairman
University of Surrey
Centre for Satellite Engineering Research
Guildford, Surrey
GU2 5XH
England

Submissions can also be made to the programme chairman via fax on +44 0483 259503 or via the Internet to: D.Loughmiller@ee.surrey.ac.uk. Abstracts and papers should only be sent to the addresses listed above.

The annual AMSAT-UK Colloquium is the largest international gathering of amateur satellite enthusiasts and experts in the world and has established a high standard of quality presentations on topics relevant to the amateur

satellite community. Organizers of this year's event would welcome all contributions of program material covering the vast scope of the amateur satellite program as it exists in 1994. The ninth AMSAT-UK colloquium promises to be the most informative and entertaining event yet. We look forward to your participation in this year's Colloquium.

* SAREX NEWS *
==========
The following message from the STS-59 crew was received via SAREX by Dave, N6JLH in California:

We used the SAREX rig today to talk with 2 of our astronauts now stationed in Star CIty, near Moscow, and 2 cosmonauts. One of the astronauts was my friend and former STS-37 crewmate, Ken Cameron, R3/KB5AWP. Ken also got me into ham radio. It was terrific to hear his voice after several months corresponding by e-mail only! Linda, N5RAX and I and crewmate Kevin Chilton spoke to Ken and the cosmonauts including U6MIR, Anatoli Artsibartski, on two succesive orbits. What a great way to use ham radio!
They were standing near the Yuri Gagarin statue, using an HT with a 5/8 whip, standing on a car to increase their elevation!

73, Jay N5QWL 01:10 UTC 17 April 1994

* VE7BQH MAKES DXCC ON 144 MHZ *
==========
Heartiest congratulations to Lionel Edwards, VE7BQH, on becoming the fourth radio amateur to receive a DXCC award for 144 MHz, reported in May QST. What's more, Lionel did it with an antenna having forward gain of approximately 23.7 dBd, about 5 dB smaller than that of anyone else to have reached this exalted level of VHF DXing (so far, W5UN, KB8RQ and SM7BAE). The 336-element collinear array at VE7BQH is rotatable in the Z axis (polarization) as well as the normal X and Y axes (azimuth and elevation), which accounts for some of Lionel's outstanding results; his own operating ability, dedication and persistence over many years obviously contributed as well.

VE7BQH is perhaps best known as the ever-patient, ever-helpful net control station, premier technical advisor and chief schedule-arranger of the 2-meter EME Net, which meets each Saturday and Sunday on 14.345 MHz, a role he has filled without peer for many years. It's fair to say that without Lionel, 144 MHz EME would not have become anything like what it is today, and none of those using the mode could possibly have accomplished even a fraction of what they have done so far.

Congratulations, Lionel, thanks for everything and please keep up the great work you're doing for all of us!

[Info via Ray Soifer, W2RS]

* GARC WORLD WIDE WEB SERVER NEWS *
==========
The NASA Goddard Amateur Radio Club, Inc. in Greenbelt, Maryland has been working behind the scenes on projects that may benefit all amateur radio operators in general and perhaps AMSAT members in particular.

Astronaut Ron Parise, WA4SIR, has been beta testing a BBS which is accessible via the Internet through telnet and ftp, telephone modem, and packet radio (locally on 145.090 MHz and nonlocally through "packet wormholes"). With Ron's heavy STS-67 crew training as of late, Jim Blackwell N3KWU is picking up much of the work to complete the beta phase.

The BBS contains Keplerian orbital elements updated daily, AMSAT bulletins, SAREX bulletins, club member mail service, club announcements, space shuttle mission info and lots more.

Access via Internet: wa3nan.gsfc.nasa.gov or 128.183.105.17
via landline: 301-286-4137
via packet: see above parenthetical

Additionally, the Goddard Amateur Radio Club has a home page for public viewing on the GARC World Wide Web server. It contains the latest GARC Newsletter in electronic form, latest space shuttle keps, GARC calendar of events, details of upcoming club activities, current WA3NAN QSL card, club facility-repeater-BBS info, a morse code experiment and more.

WWW access URL:
http://macgwy-mac2.gsfc.nasa.gov/garc/wa3nan-home-page.html

The GARC Web server was developed and is maintained by club president Jim Blackwell N3KWU (n3kwu@amsat.org). You are invited to check out its potential. This medium is the hottest item on the Internet today.

73, Pat WD8LAQ Internet: wd8laq@amsat.org

Archive-name: radio/rec-radio-info/welcome
Last-modified: $Date: 1994/01/02 22:00 $
Version: $Revision: 1.06 $

*** Welcome to rec.radio.info! ***

Welcome to rec.radio.info, a group that aims to provide a noise-free source
of information and news for the entire rec.radio hierarchy.

Two introductory articles about rec.radio.info are posted to the group and
to news.answers every two weeks. You are now reading the first article, which
explains what rec.radio.info is, and answers some Frequently Asked Questions.
The second article is titled "Submission Guidelines", and you only need to
read it if you want to submit an article to rec.radio.info.

You can skip to the next section of this article by searching for the next
" -- " string. The sections available are:
- What is the purpose of rec.radio.info?
- Why are messages almost always cross posted to rec.radio.info?
- What is a 'follow-up', and what does 'moderated' mean?
- OK, so now I know what 'moderated' means. Tell me more.
- What type of material is considered inappropriate?
- I do not have access to news, how can I get the information posted to
rec.radio.info?
- Will the material appearing in rec.radio.info be archived somewhere?
- I have a regular posting with timely information, is there a way to
speed up it's delivery, or automate for more convenience?

-- What is the purpose of rec.radio.info?

The purpose or charter of rec.radio.info is to provide the Usenet community with
a resource for information, news, and facts about any and all things radio.

All the other rec.radio groups are intended for discussions and general chit
chat about radio. Rec.radio.info will contain informational, factual articles
only. Follow-ups are redirected to an appropriate other group, and further
discussion (if any) will not take place in rec.radio.info.

In order to ensure that rec.radio.info contains only appropriate articles, it
was decided to create the group as a moderated newsgroup.

-- Why are messages almost always cross posted to rec.radio.info?

It provides a "tag" for each article to be assembled into a filtered
presentation in rec.radio.info (even with cross-posting, only one message, with
```

a unique Message-ID, is propogated across the net). This tag also facilitates a pre-existing method of dropping or cancelling the articles locally within the discussion groups if you don't want to see them. This accommodates individuals who want to separate the bulletins from the discussions, discussions from the bulletins, as well as those who are adamant about not reading another newsgroup and wanted to see everything all in one basket.

With the total size of Usenet (in number of newsgroups and total traffic) doubling every year or so, this is no insignificant contribution to reducing information noise and chaos. Making the discussion groups a catch-all, and making extra newsgroups filters on that catch-all, is also the most realistic way to implement such a scheme (It's not intuitively obvious what the charter, contents, and general appropriate topics for each and every newsgroup are. Seeing FAQ's and charter/intro postings in the home newsgroup is beneficial for new readers).

By cross-posting one only is adding a few tens of bytes to each bulletin (to specify the extra group on the Newsgroups line), but are adding the capability for very powerful filtering features available on most news servers, listservers and readers. Your local news guru could probably explain these features in more detail.

In rn, for example, according to Leanne Phillips in her rn kill-file FAQ, add a line of the form:
/Newsgroups:.*[,]rec\.radio\.info/h:j
either in ~/News/KILL (if you don't want to see rec.radio.info articles anywhere) or ~/News/rec/radio/amateur/misc/KILL (if you don't want to see them just in rec.radio.amateur.misc). The latter method means your kill file will only be consulted during rec.radio.amateur.misc (and hence runs more efficiently), and will probably work for most people.

In nn, according to Bill Wohler in his nn FAQ, add a line of the form:
rec.radio.info:!s/:^
in ~/.nn/kill (if you don't want to see rec.radio.info articles anywhere), or put the following lines:
sequence
rec.radio.info
rec.radio.
at the end of ~/.nn/init in order to see all the rec.radio.info bulletins first, then read the remaining rec.radio.* without the bulletins.

-- What is a 'follow-up', and what does 'moderated' mean?

If you are new to Usenet and are not familiar with the terminology, you might want to read the general introductory articles found in the newsgroup news.announce.newusers. Doing so will make your life on the net much easier, and will probably save you from making silly beginner's mistakes.

If you think that at this moment you are reading an echo, a conference, or a bulletin board, I'd also strongly suggest a trip over to news.announce.newusers.

For the rest of this article, I will assume you have a basic knowledge of Usenet terminology and mechanics.

A moderated group means that any article that needs to be posted to the group has to be accepted by the moderator of the group. Since we need to ensure that followups to an article (discussion) do not show up in the rec.radio.info newsgroup, the `Followup-To:' header line contains a newsgroup that is appropriate for disussions about the specific article.

-- OK, so now I know what 'moderated' means. Tell me more.

Rec.radio.info is a moderated newsgroup, which means that all articles submitted to the group will have to be approved by the moderator first.

The current moderator of the group is Mark Salyzyn. Submissions to rec.radio.info can be posted, or e-mailed to:

rec-radio-info@ve6mgs.ampr.ab.ca

Comments, criticisms, suggestions or questions about the group can be e-mailed to:
rec-radio-request@ve6mgs.ampr.ab.ca

But before you do so, please be sure to check out the "Submission Guidelines" article.

The influence of the moderator should be minimal and of an administrative nature, consisting chiefly of weeding out obviously inappropriate articles, while making sure correct headers etc. are used for the appropriate ones.

-- What type of material is considered inappropriate?

There are three broad categories of articles which will be rejected by the moderator:

1) Requests for information: rec.radio.info is strictly a one-way street. I receive information in my mailbox; I then post it to rec.radio.info. Requests for specific information belong in the normal discussion newsgroups. If your request gets answered, you might consider passing the answer on to rec.radio.info, though. Especially if you can edit it into a informational, rather than a discussion, format.

2) Obvious discussion articles, or articles that appear unsubstantiated.

3) Commercial stuff: a relatively unbiased test of a radio product would be accepted, but any hint of for-profit might be reason for rejection. For three reasons: This is not the purpose of the list, for-profit is a controversial topic, and this list may be passed onto Amateur Packet Radio (where for-profit is prohibited except under certain provisos).

rec.radio.swap (or possibly comp.newprod) may be more deserving of the posting in any matter.

Similarly, copyrighted material generally cannot be used. If it's TRULY worthwhile to the net, I would recommend obtaining permission from the copyright holder. Please note the source, and if permission was given. I

reserve the right to make the final decision concerning appropriateness in all situations. In most cases, a brief summary of, or pointer to, the copyrighted information may be all I can allow.

-- I do not have access to news, how can I get the information posted to rec.radio.info?

brian@UCSD.EDU (Brian Kantor) has kindly supplied a mail list server for rec.radio.info. Non of the articles will be digested, due to their size, so you will receive individual mailings for every article posted to the group.

Mail sent to radio-info@ucsd.edu will be forwarded to the moderator and thus is an alias to rec-radio-info@ve6mgs.ampr.ab.ca

To subscribe and unsubscribe via the listserver; the format for that is

sub address radio-info
unsub address radio-info

where 'address' is your full mailing address. Send this request to

listserv@ucsd.edu

Note that the server will automatically delete any address that bounces mail. If you leave the address portion blank, it will try to deduce your address from the mail headers. This may not work if you are on bitnet, milnet or some other non-Unix host, so it is recommended to put your return address in any case. For example:

sub mymailbox@myhost.mydomain.mil radio-info
or
sub MEMEME01@DMBHST.bitnet radio-info

or something like that.

-- Will the material appearing in rec.radio.info be archived somewhere?

Yes. Still firming up details at the moment but here is a preliminary list:
- unbc.edu as maintained by Lyndon Nerenberg <lyndon@unbc.edu>
- nic.funet.fi maintained by Risto Kotalampi <rko@cs.tut.fi>
saved to /pub/dx/text/rec.radio.info currently stored as numbered files.

Effectively this means that anything you post to rec.radio.info will be permanently stored, so your work will not be lost.

-- I have a regular posting with timely information, is there a way to speed up it's delivery, or automate for more convenience?

Yes, there is! It may take a bit of chatter with the moderator, but we are willing to take responsible people and provide them the means of posting the articles directly from their site. We will try everything we can as we fully realize that DX (distant signal) and astronomical data can be somewhat transitory. We are also willing to allow regular posters of information the same courtesy, even if the information is not as time critical.

We refer to this as self-moderation, which is partly based on the model for news.answer. This requires co-operation and good will to be beneficial to the community in the rec.radio hierarchy.

I suggest reading the posting guidelines for more information. I am open to suggestions.

I thank the following individuals for their input into this article:
rec.music.info moderator Leo Breebaart rec-music-info@cp.tn.tudelft.nl
rec.radio.broadcasting moderator Bill Pfeiffer wdp@gagme.chi.il.us
Paul W. Schleck, KD3FU pschleck@unomaha.edu
Ian Kluft, KD6EUI ikluft@uts.amdahl.com

--

658. Re: SAREX and Baycom ?

Newsgroup: rec.radio.amateur.space
Date: 1994-05-01 09:21:57 UTC
From: da884@cleveland.Freenet.Edu
Message-ID: <2pvsbl$jql@usenet.INS.CWRU.Edu>
Source record: 27511

I haven't tried SAREX, but just this week I had two connects with MIR
from my condo, just stick the magmount out the window, I'm on the second
floor of a 30 floor condo, and using my HT and 5 watts hit the thing, but
started to get drowned out by the biger stations. Not bad. I also heard
packet on AO-21 got a few from RUDAK on the downlink freq.

660. PB Error Messages - Meaning and How to Respond/Correct?

Newsgroup: rec.radio.amateur.space
Date: 1994-05-02 10:53:33 UTC
From: seeler@UPEI.CA
Message-ID: <seeler.112.767876012@UPEI.CA>
Source record: 27513

This weekend I had two excellant passes of KO-23. During both passes the following Error Messages occured repeatedly:

Out of Memory

Error Allocating hole to init file

What are the meanings of these two messages and what are the most likely causes? I was not able to find the information in the PB documents.

The setup is a DSP2232 serially connected to a 486 SX (20 MHz) at 19200 . The software is running in DOS and there is only one TSR in memory (loaded high) - an evaluation copy of rightime - to keep the computer time accurate. I am using the serial monitoring capability of Rightime so that it does not interfere with the operations of PB.

I did reboot the computer each pass and in one instance the error messages re-occured and in the other they only appeared once and then PB settled down.

Any suggestions or comments would be welcome.

Hello,

I am looking for information about the Kansas City Tracker/Tuner or
any similiar device. If you know where to get these, or have one for
sale, please send email.

Thanks,

Greetings,

I am looking for recommendations (and used items if you have them) for pre-amps for 145 and 435MHz. I have looked at units made by ARR, SSB, and Mirage/KLM. So far, the Mirage/KLM KP-2 series looks like the best price/performance package.

Thanks,

+---+

I just uploaded by satellite orbital prediction software to pilot.njin.net.
It's called "predict.zip" and is located under the /pub/SpaceNews/software
subdirectory.

Enjoy!

* AO-27 OPERATING NOTES *
========================
AO-27 has had its FM transponder in operation on the weekends when the spacecraft is in sunlight. The transponder on AO-27 receives on an uplink frequency of 145.850 MHz FM, and downlinks on 436.800 MHz FM. As of yet, no official operating schedule has been announced, but that hasn't stopped amateur experimenters from communicating with others through the satellite.

As an example, John, N8QGC, has been working stations on AO-27 all the way from his Detroit area QTH to as far away as Mexico City, Mexico, Baffin Island, and the North West Territories. N8QGC usually works AO-27 from a mobile station using 10 watts of transmitter power from his Kenwood TM-731A and a homebrew 1/4 wave antenna. Even with his low power and small antenna system, John has no problem securing a strong signal into the satellite. He has even tried accessing the satellite with his ICOM IC-U2AT running 2.5 watts and a rubber duck antenna and also had a good uplink signal (especially during periods when larger stations were not clobbering the satellite uplink with excessively strong signals). Due to the extreme sensitivity of this satellite, uplink ERP should be kept below 25 watts.

AO-27 control station Mark, N4TPY, has reported that the satellite has a transponder output power of between 2 and 3 watts at the present time, and as such, is nearly impossible to receive on a HT with a rubber duck. Omni-directional antennas have provided only limited results.

N8QGC uses a 6 element KLM 440-6X yagi rated at 8.9 dB gain to copy AO-27's downlink signals. He aims it out his car window and receives the satellite well. The doppler shift experienced when communicating through this satellite can be quite high. John usually starts listening for AO-27 at 436.805 MHz, and tracks it down to 436.790 MHz at LOS.

Santoyo V. Ramon, XE1KK, of Mexico City has reported hearing Spanish speaking stations through AO-27 with very strong signals. They are not hams, nor are they hearing the satellite downlink. He believes they are located in the Caribbean zone, probably Cuba or Puerto Rico, and have been heard talking about union elections. He is actively tracking down the source of these signals.

[Info via N8QGC, XE1KK, and ANS]

* KEPLERIAN DATA AVAILABLE *
==========
Up-to-date Keplerian data in the NASA 2-line format is available via the Internet at archive.afit.af.mil (129.92.1.66) using anonymous ftp. Files such as amateur.tle, glonass.tle, gorizont.tle, gps-ops.tle, gps.tle, tvro.tle, visual.tle, and weather.tle are located in the /pub/space subdirectory at this site.

* OSCAR-11 NEWS *
==========
The Digitalker has been activated on the UoSAT-OSCAR-11 satellite. UO-11 has an FM downlink on 145.826 MHz, and the voice messages are interspersed with telemetry and news bulletins sent at 1200 bps using AFSK modulation.

SB SAT @ AMSAT $ANS-120.01
AO-13 OPS NET SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 120.03 FROM AMSAT HQ
SILVER SPRING, MD APRIL 30, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-120.01

Current AMSAT Operations Net Schedule For AO-13

AMSAT Operations Nets are planned for the following times. Mode-B Nets are conducted on AO-13 on a downlink frequency of 145.950 MHz. If, at the start of the OPS Net, the frequency of 145.950 MHz is being used for a QSO, OPS Net enthusiasts are asked to move to the alternate frequency of 145.955 MHz.

Date UTC Mode Phs NCS Alt NCS
09-May-94 0000 B 175 W5IU WA5ZIB
14-May-94 1700 B 167 WA5ZIB W5IU
21-May-94 2130 B 185 VE2LVC W9ODI

Any stations with information on current events would be most welcomed. Also, those interested in discussing technical issues or who have questions about any particular aspect of OSCAR statellite operations, are encouraged to join the OPS Nets. If neither of the Net Control Stations show up, any participant is invited to act as the NCS.

Slow Scanners are invited to join the SSTV sessions on AO-13. The frequency is 145.955 MHz. The net meets at 45 minutes before Mode S, and on Mode B following Mode S on Saturdays and Sundays. Join those sessions or convey your wishes for other SSTV skeds to wb6llo@amsat.org, and he will coordinate your efforts.

[Kazu Sakamoto (JJ1WTK) qga02014@niftyserve.or.jp]

KO-25: N7RYW has noticed that KO-25 started to become very difficult for him to uplink to. This began for him over a week ago. At first, he attributed the difficulty to the nearness of AO-21. This week he noticed that AO-21 was far out of sight of KO-25, and yet the trouble remained. N7RYW does not belive that his keps for AO-21 are off and thus he feels there might be something bothering KO-25's receiver. He is wondering if the receiver was switched to the secondary frequency. If so, it may be hard to find, as it was when KO-25 was first activated. In that instance, it was found to be off from its published frequency. N7RWY will be testing various uplinks over the next few days to see if he can find where its secondary uplink frequency is located. If there any other KO-25 users have had problems, please send N7RYW a note at his INTERNET address of n7ryw@teleport.com. In a further status report received from WH6I, he also notes that KO-25 has been deaf with many stations thinking that AO-21 was the cause of the desensing of KO-25's reciever. However, analysis of the telemetry and many "re-tries" by some stations with a lot of power seems to indicate that desense is not the problem. In fact KO-25 has been deaf even when AO-21 is not near it. At the moment it seems that there might be a software problem, or perhaps the receiver is on a different (unknown) frequency. [N7RYW & WH6I]

AO-16: Working well. [WH6I]

LO-19: Operating normally. [WH6I]

KO-23: Operating Normally. [WH6I]

RS-10/11: Operating normally with very strong signals. [ZS6AOP]

MIR: N0XCZ reports that MIR's Personal Bulletin Board System (PBBS) is quite active but it appears to be running with low power. Stations can be heard but with weak signals. The MIR PBBS can be heard and worked on a frequency of 145.550 MHz, FM, simplex. [N0XCZ]

The AMSAT NEWS Service (ANS) is looking for volunteers to contribute weekly OSCAR status reports. If you have a favorite OSCAR which you work on a regular basis and would like to contribute to this bulletin, please send your observations to WD0HHU at his CompuServe address of 70524,2272, on

INTERNET at wd0hhu@amsat.org, or to his local packet BBS in the Denver, CO area, WD0HHU @ W0LJF.#NECO.CO.USA.NOAM. Also, if you find that the current set of orbital elements are not generating the correct AOS/LOS times at your QTH, PLEASE INCLUDE THAT INFORMATION AS WELL. The information you provide will be of value to all OSCAR enthusiasts.

/EX

666. Two-Line Orbital Element Set Format

Newsgroup: rec.radio.amateur.space
Date: 1994-05-03 00:51:35 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.767926295@afit.af.mil>
Source record: 27520
Cross-posted to: rec.radio.amateur.space,rec.radio.info

As a service to the satellite user community, the following description of the NORAD two-line orbital element set format is uploaded to sci.space.news and rec.radio.info on a monthly basis. The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity. In addition, element sets (also updated daily) and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 0 is a eleven-character name.

Lines 1 and 2 are the standard Two-Line Orbital Element Set Format identical to that used by NORAD and NASA. The format description is:

```
Line 1
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods, plus signs = 0; minus signs = 1)
```

Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

667. Two-Line Orbital Element Sets (TLE386)

Newsgroup: rec.radio.amateur.space
Date: 1994-05-03 00:54:07 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.767926447@afit.af.mil>
Source record: 27517

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

668. Russian space station MIR

Newsgroup: rec.radio.amateur.space
Date: 1994-05-03 20:05:57 UTC
From: jbhertzb@unix.amherst.edu
Message-ID: <2q6ar5$4f9@amhux3.amherst.edu>
Source record: 27522

Can anyone tell me what MIR's uplink and downlink frequencies are, how often they are likely to transmit, and whether there are any hams aboard at this time?

Thanks.
-Jared Hertzberg N2YES

Hi, I read on space-news boletin, about AO-27 satellite, and I'm interesting to make a contact with the AO-27, but I don't no if it possible connect it in my zone (Chile South America). Please if anyone have more information about it, please send me a e-mail to ce6fyn@ce6fyn.radio.cl.

Thanks and 73's

CE6FYN

679. Mac Satellite Tracking Program

Newsgroup: rec.radio.amateur.space
Date: 1994-05-06 14:53:23 UTC
From: mmjjmm@post.its.mcw.edu
Message-ID: <2qdll3$icm@post.its.mcw.edu>
Source record: 27526

What is the best satellite tracking program for use on a Macintosh
computer and where can it be located?

680. Two-Line Orbital Element Sets (TLE389)

Newsgroup: rec.radio.amateur.space
Date: 1994-05-06 23:27:22 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.768266842@afit.af.mil>
Source record: 27527

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.
